Conference or Workshop Item (Published Version)

The aim of the Leeds Beckett Repository is to provide open access to our research, as required by funder policies and permitted by publishers and copyright law.

The Leeds Beckett repository holds a wide range of publications, each of which has been checked for copyright and the relevant embargo period has been applied by the Research Services team.

We operate on a standard take-down policy. If you are the author or publisher of an output and you would like it removed from the repository, please [contact us](#) and we will investigate on a case-by-case basis.

Each thesis in the repository has been cleared where necessary by the author for third party copyright. If you would like a thesis to be removed from the repository or believe there is an issue with copyright, please contact us on openaccess@leedsbeckett.ac.uk and we will investigate on a case-by-case basis.

Visual Associative Memory: Age- and Individual differences during Learning & Retrieval

Introduction

Grapheme – colour Synaesthesia

Fact 1: Grapheme – colour Synaesthesia improves visual associative memory and visual memory in general¹

Fact 2: Elderly participants have impaired memory for visual associations, but memory for individual items is preserved relative to control young control subjects²

Predictions

- Performance accuracy on *pair – associative memory* is expected to yield a significant group effect:
Synaesthetes > Controls > Elderly
- Performance accuracy on *single item memory* will show the same pattern as for pair – associates, but is not expected to be significant

Exploratory question

- Do Synaesthetes show a memory advantage during learning³ or retrieval¹ of pair – associates, or both ?

Method

Participants

7 young Synaesthetes [M=22 (3.56)]; 7 Elderly [M=67 (7.4)]; 7 young Controls [M=23 (3.4)]

Learning Phase

→ *Pair – associative learning*

Participants learned 8 pair – associates to 87% criterion

Memory load manipulation

5 visually dissimilar pairs

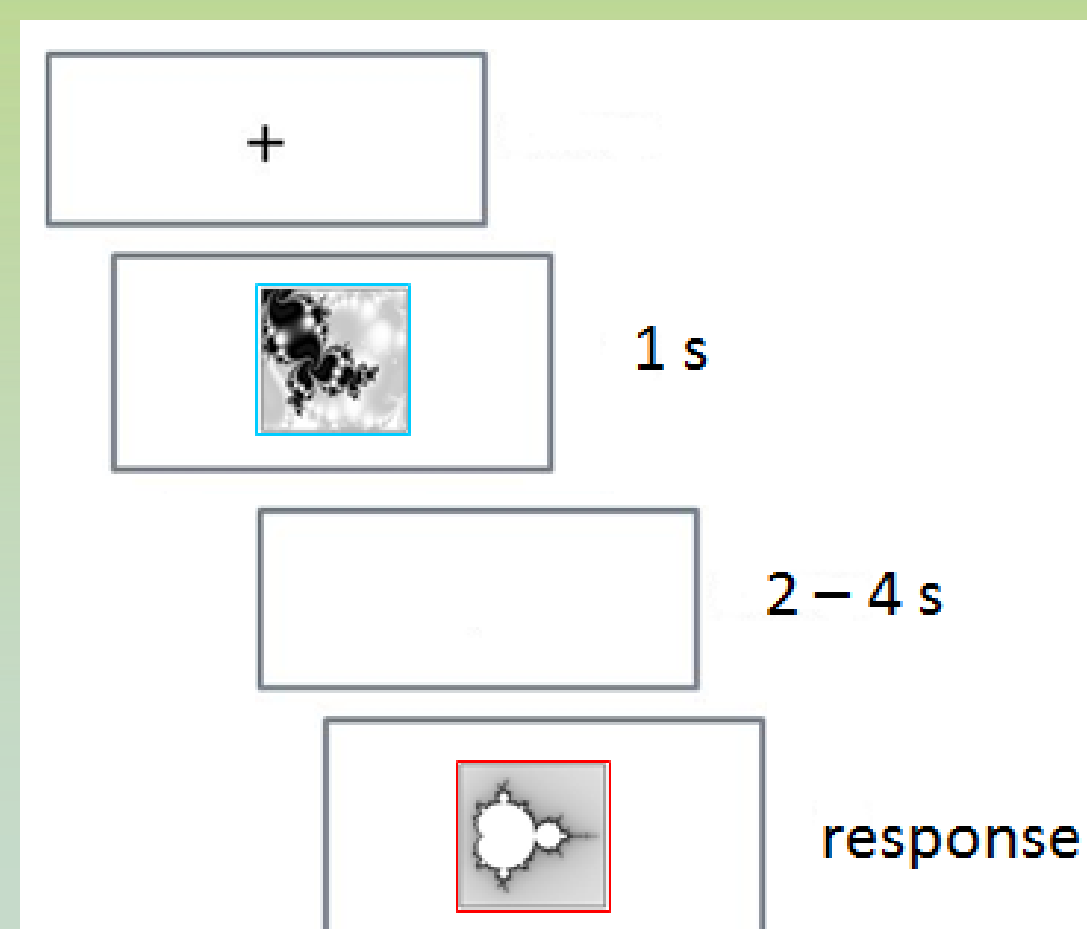

3 visually similar pairs

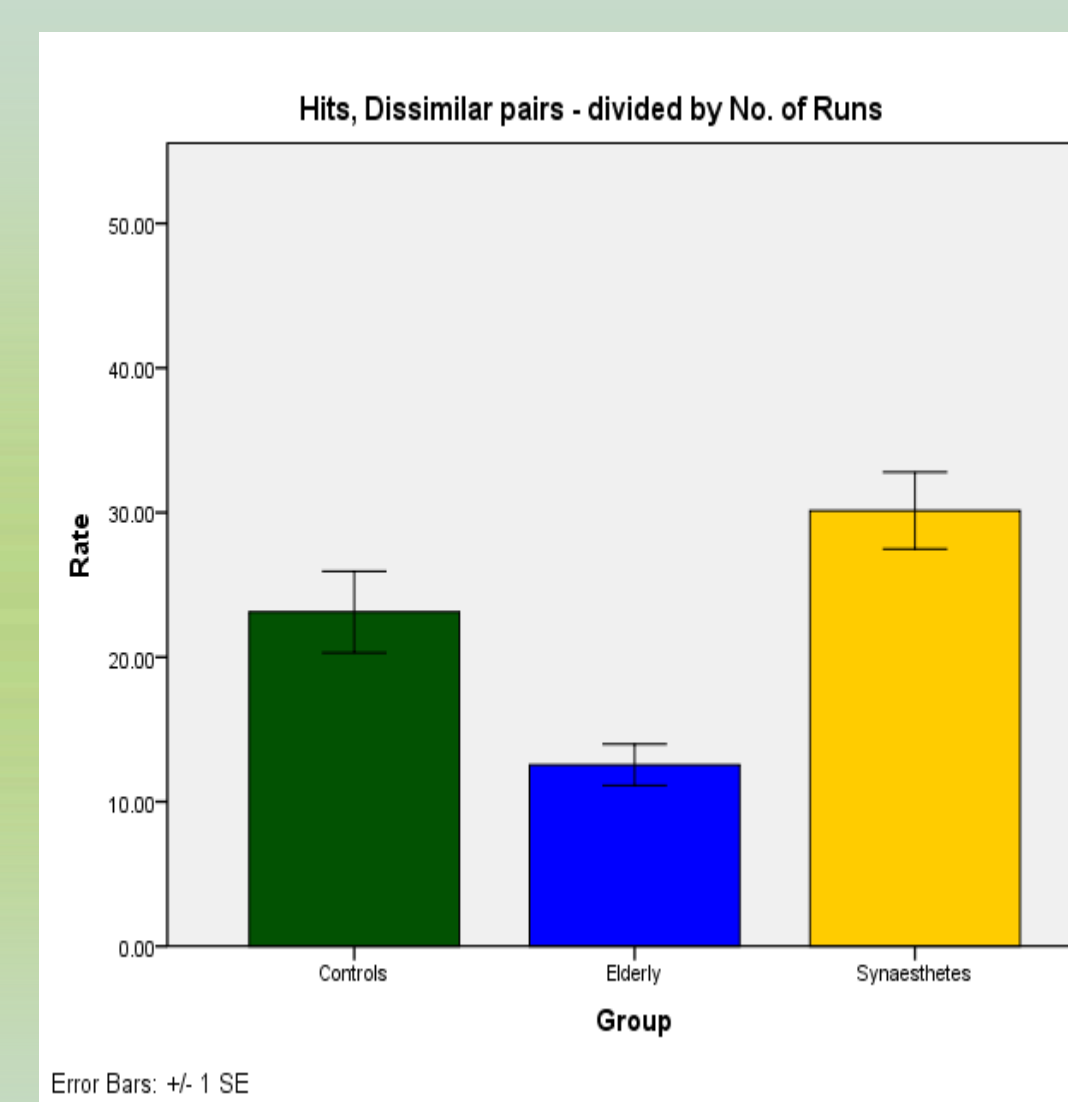

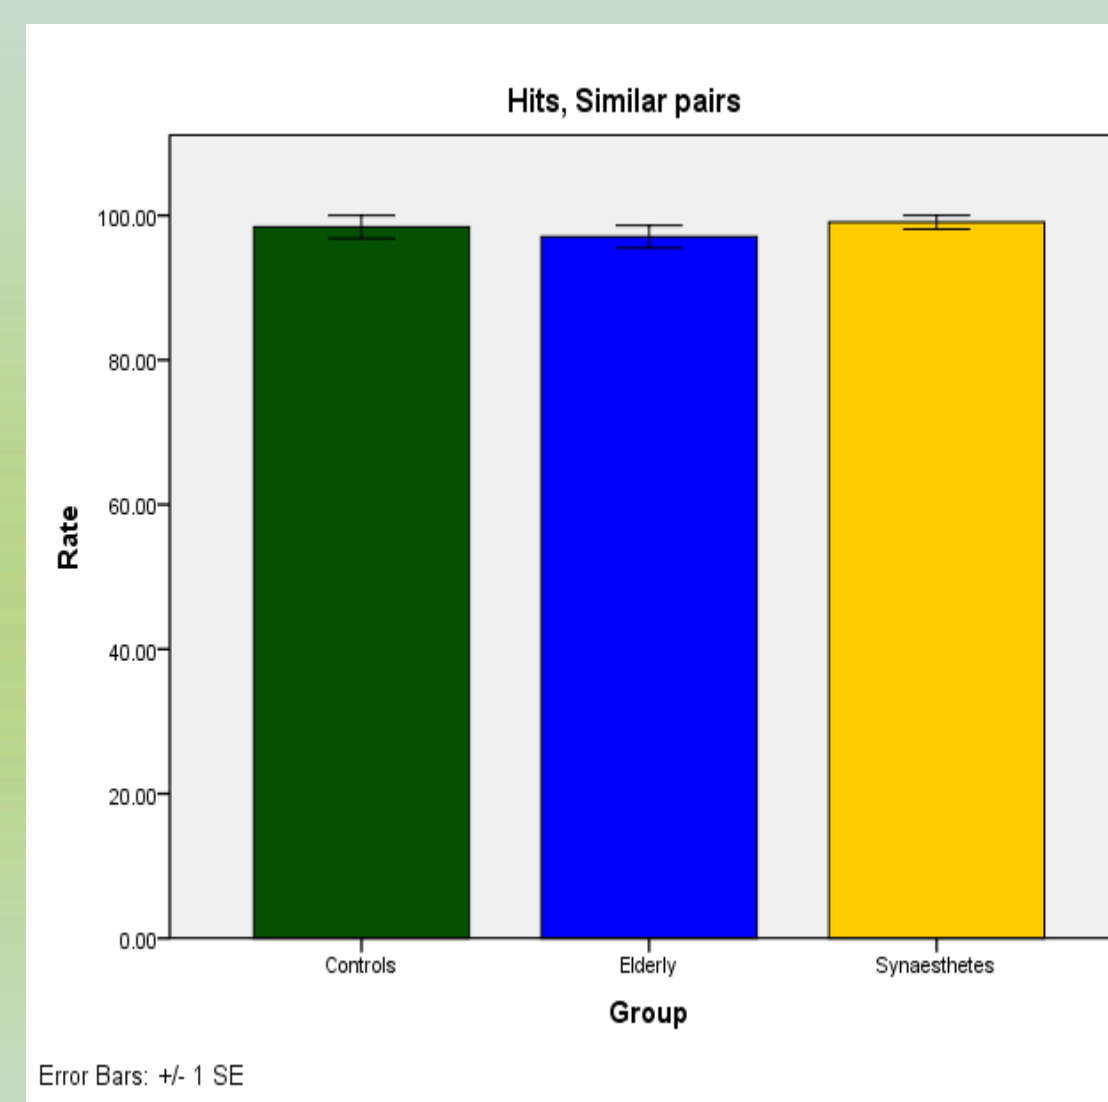

→ *Singleton learning*

Participants learned 8 single fractal images to 87% criterion

Pair – associative retrieval

Results, Pair - learning

Mean No. of Runs

Controls = 4.14 (SE = .86)
Elderly = 8.14 (SE = 2.09)
Syns = 3.14 (SE = .46)

Syns > Cont, $p = .098$

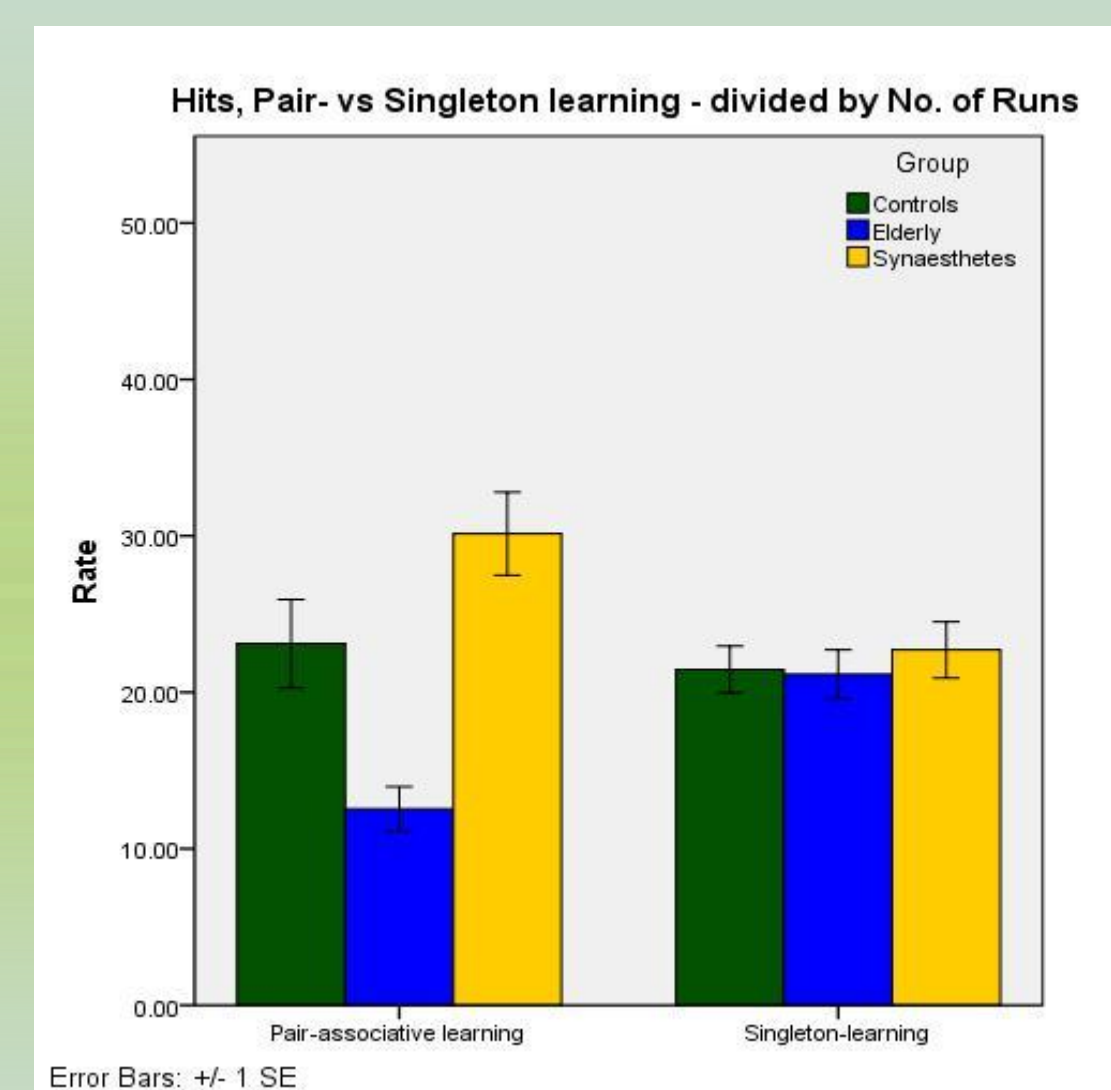

Cont > Old, $p = .006$

Syns > Old, $p < .001$

→ No effect of group $F[2,60] = .536, p = .588$

→ Sign. effect of group $F[2,102] = 13.81, p < .001$

Results, Pair - vs Singleton learning

→ No effect of Learning Type $F[1,102] = .01, p = .921$

→ Main effect of group $F[2,102] = 9.91, p < .001$

→ Sign. interaction $F[2,102] = 9.03, p < .001$

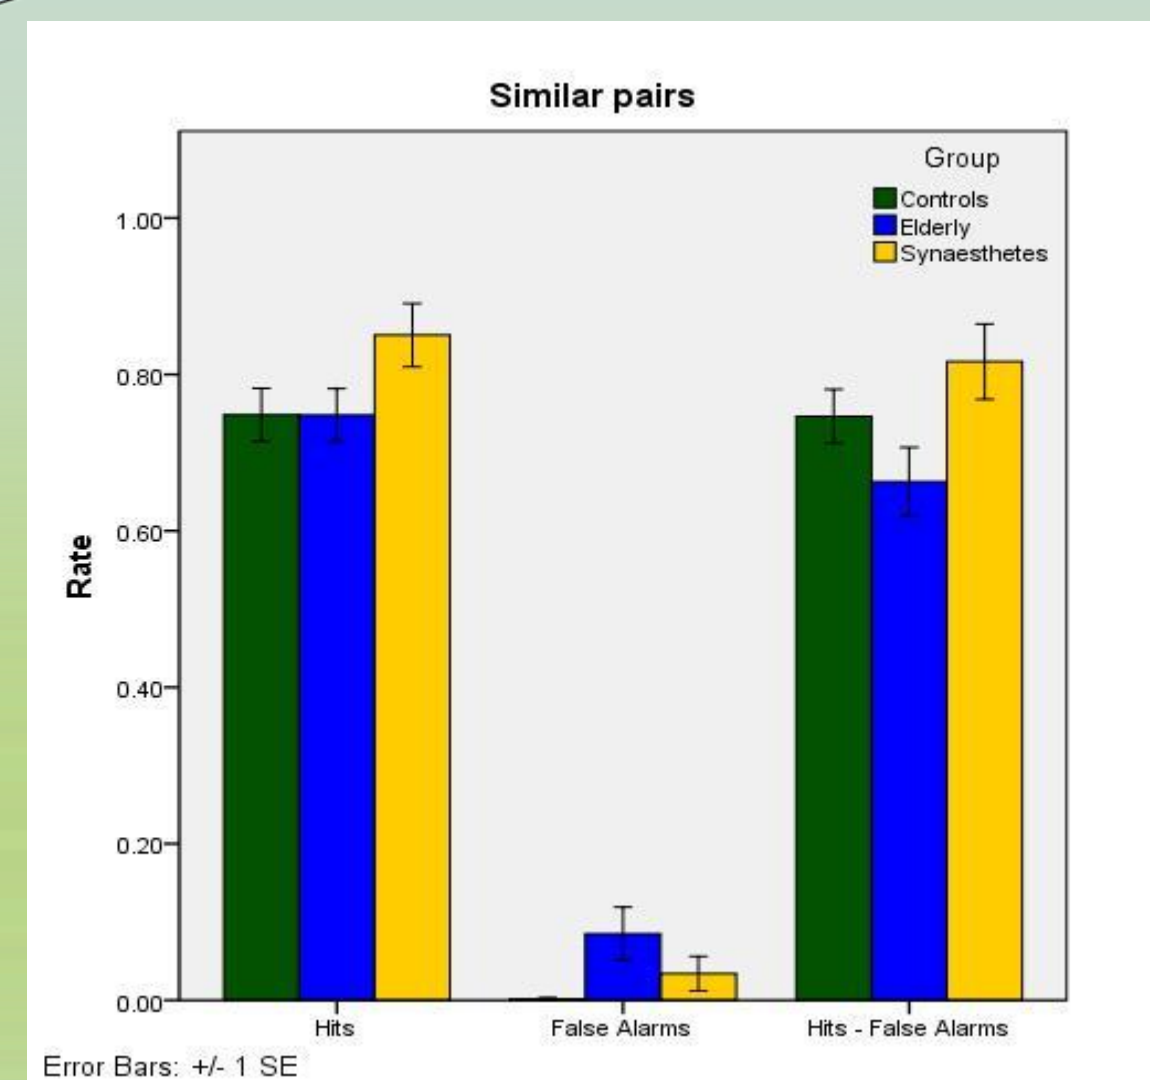

Syns > Control, $p = .058$

Control > Elderly, $p = .013$

Syns > Elderly, $p < .001$

Note: Pair-associative learning = dissimilar pairs only

Results, Pair-associative retrieval

d-prime

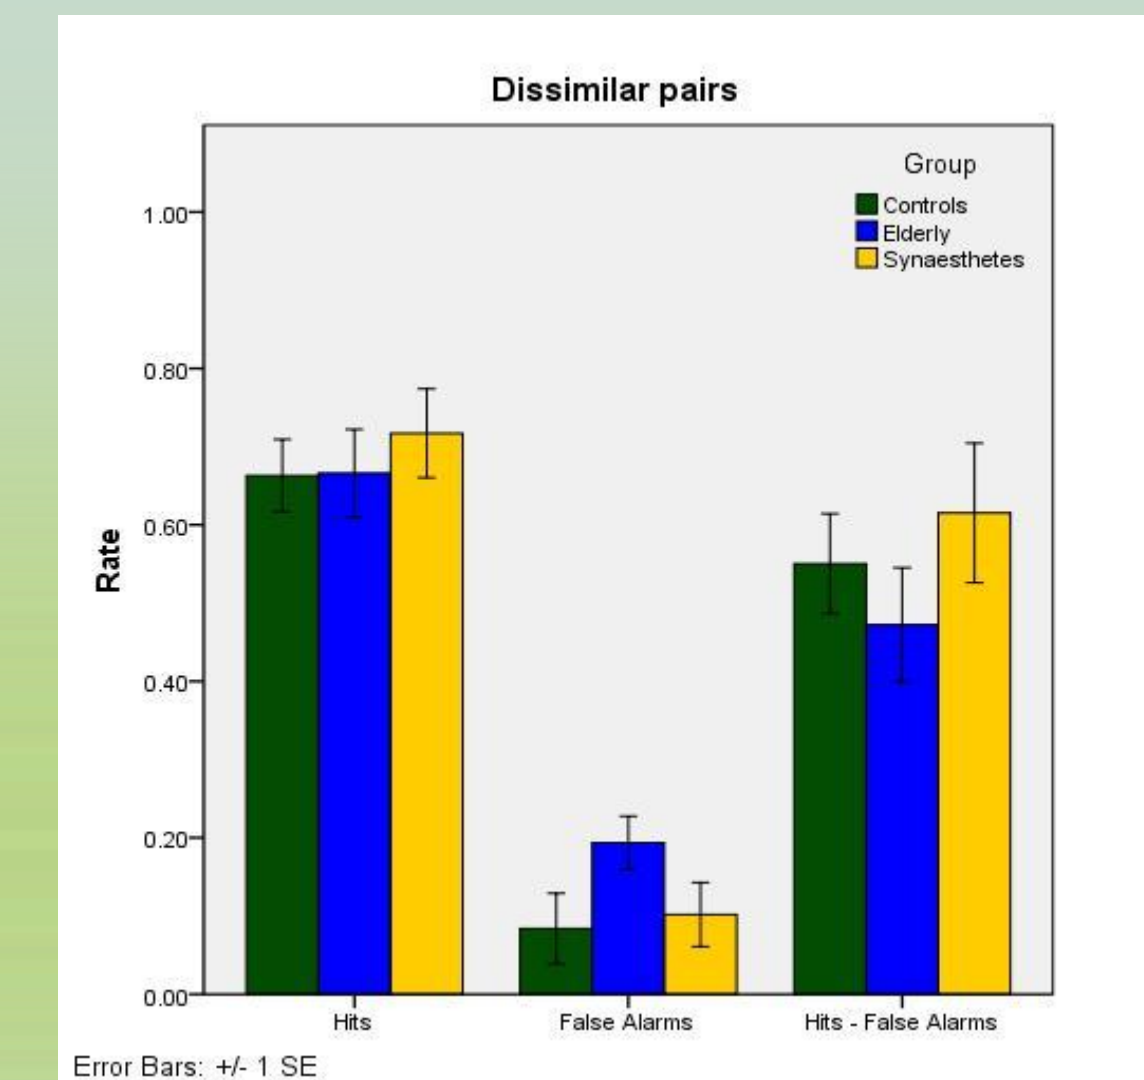

Controls = 1.58 (SE = .07)

Elderly = 1.37 (SE = .12)

Synaesthetes = 1.64 (SE = .37)

$F[1,60] = 2.38, p = .101$

Note: higher d' = better discrimination between target-match and target non-match

d-prime

Controls = 1.02 (SE = .08)

Elderly = .73 (SE = .11)

Synaesthetes = .99 (SE = .10)

$F[1,102] = 2.51, p = .086$

Conclusions

Visual associative learning

→ Synaesthesia leads to a significant advantage in associative learning of visually unrelated (dissimilar) information, but shows no advantage on associating visually similar items or on learning single items.

→ By contrast, Age significantly impairs the ability to associate visually unrelated information, but spares associative learning for visually similar items and single items.

Visual associative memory

→ Synaesthetes showed no persistent associative memory advantage at retrieval, an effect that appeared to be influenced by poorer discrimination ability between true and false associations.
