The aim of the Leeds Beckett Repository is to provide open access to our research, as required by funder policies and permitted by publishers and copyright law.

The Leeds Beckett repository holds a wide range of publications, each of which has been checked for copyright and the relevant embargo period has been applied by the Research Services team.

We operate on a standard take-down policy. If you are the author or publisher of an output and you would like it removed from the repository, please [contact us](#) and we will investigate on a case-by-case basis.

Each thesis in the repository has been cleared where necessary by the author for third party copyright. If you would like a thesis to be removed from the repository or believe there is an issue with copyright, please contact us on [openaccess@leedsbeckett.ac.uk](mailto:openaccess@leedsbeckett.ac.uk) and we will investigate on a case-by-case basis.

Sustainable and Green Information Systems: Preparing the next generation of practitioners

Neil Gordon, Department of Computer Science, University of Hull

Collin Pattinson, School of Computing and Technology, Leeds Metropolitan University

Ah-Lian Kor, School of Computing and Technology, Leeds Metropolitan University

Keywords: Green IS/IT; Sustainable Development; IS education

Societies across the globe are recognising the potential troubles that may arise from environmental change potentially brought about by, or at least accelerated through, the actions and impact of human activity. This raises challenges for the computing industry, which is a large and growing contributor to the environmental impact of societies. The general green issues are realised as green computing within the context of IT.

Whilst environmental concerns dominate the media, they are now recognised as part of a complex set of parameters within the wider agenda of considering the long term viability and development of societies. This wider structure is framed through the concept of sustainable development – recognising issues that are entwined with environmental concerns, typically financial, scientific and governance issues.

Information systems - with its encompassing remit of IT hardware, software, data, processes, procedures and in particular people - provide an ideal framework through which to assess, plan and implement green strategies. These are relevant to businesses, as well as to government agencies. Such systems are widely expected to play a major role in the enhancement of sustainability across organisations: otherwise referred to as “greening by IT”, or “Green IT 2.0”, in which IT will support the activities and decisions required to operate in a more sustainable manner.

The complexities of these issues –with the balance between evidence for change, costs and practicalities, and longer term developments – mean that there is no simple right answer. Moreover, these issues will continue to grow in importance and impact. Current IS systems are limited in their provision for such issues, and training related to this is still in the early stages of development. So building an awareness and understanding of these in the next generation of IS practitioners, with the aim of producing a next generation able to produce systems that take account of sustainable development in its myriad forms is essential.

In this paper we review some of the approaches and issues with regards to how to develop sustainable development within IS education, and identify some of the developments required to ensure that IS fulfils its potential to enable societies to deal with the complex and challenging changes that may follow. We address the question of breadth versus depth of coverage, and provide examples of work in progress in delivering these requirements.
