Document Version:

Conference or Workshop Item (Published Version)

---

The aim of the Leeds Beckett Repository is to provide open access to our research, as required by funder policies and permitted by publishers and copyright law.

The Leeds Beckett repository holds a wide range of publications, each of which has been checked for copyright and the relevant embargo period has been applied by the Research Services team.

We operate on a standard take-down policy. If you are the author or publisher of an output and you would like it removed from the repository, please [contact us](#) and we will investigate on a case-by-case basis.

Each thesis in the repository has been cleared where necessary by the author for third party copyright. If you would like a thesis to be removed from the repository or believe there is an issue with copyright, please contact us on [openaccess@leedsbeckett.ac.uk](mailto:openaccess@leedsbeckett.ac.uk) and we will investigate on a case-by-case basis.

# What are the best nutritional outcome measures?

Helen White

# What is the value of nutritional outcome measurement?

Clinical use of data	Benchmarking and quality improvement
Quality measure in contracts	Pay for performance
Patient choice	Choosing high quality providers; informed treatment choices
Resource allocation; productivity measures	Allocate scarce resources more efficiently
Tackling Health Inequalities	Appropriate access for needs
Regulation	Assessing minimum standards
National accounting	Outcomes Frameworks and productivity

# Nutritional outcome measures

## Clinical

BMI,  
Weight  
Height  
Lean tissue mass  
Vitamin status  
Dietary intake  
Process outcome

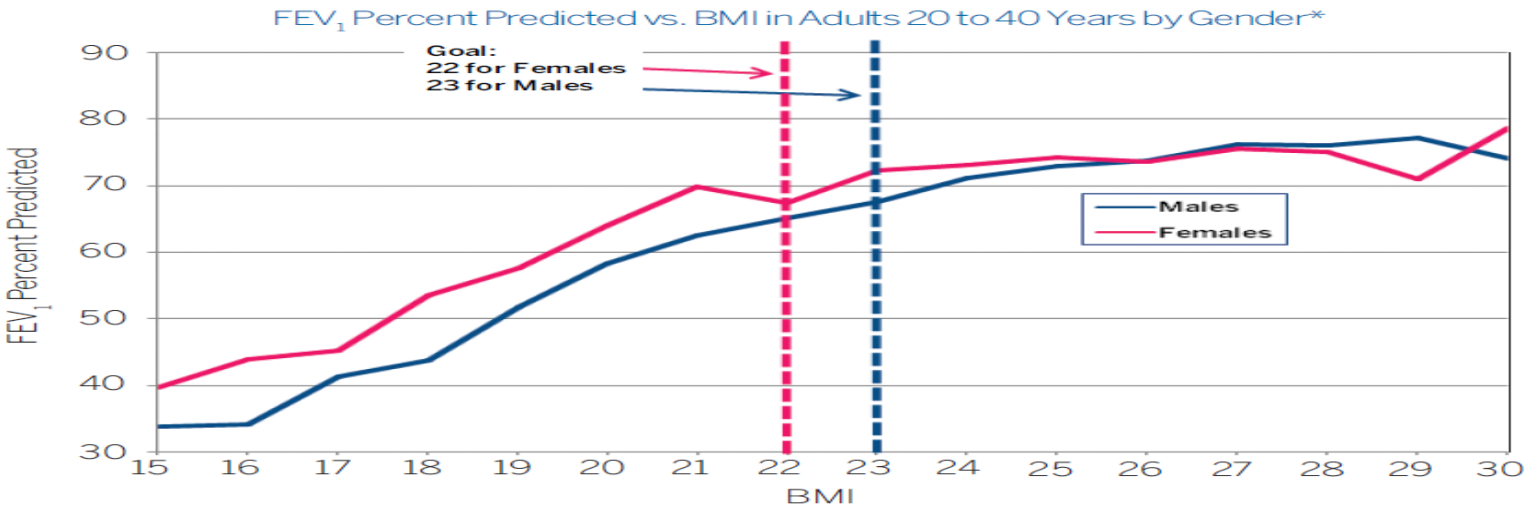

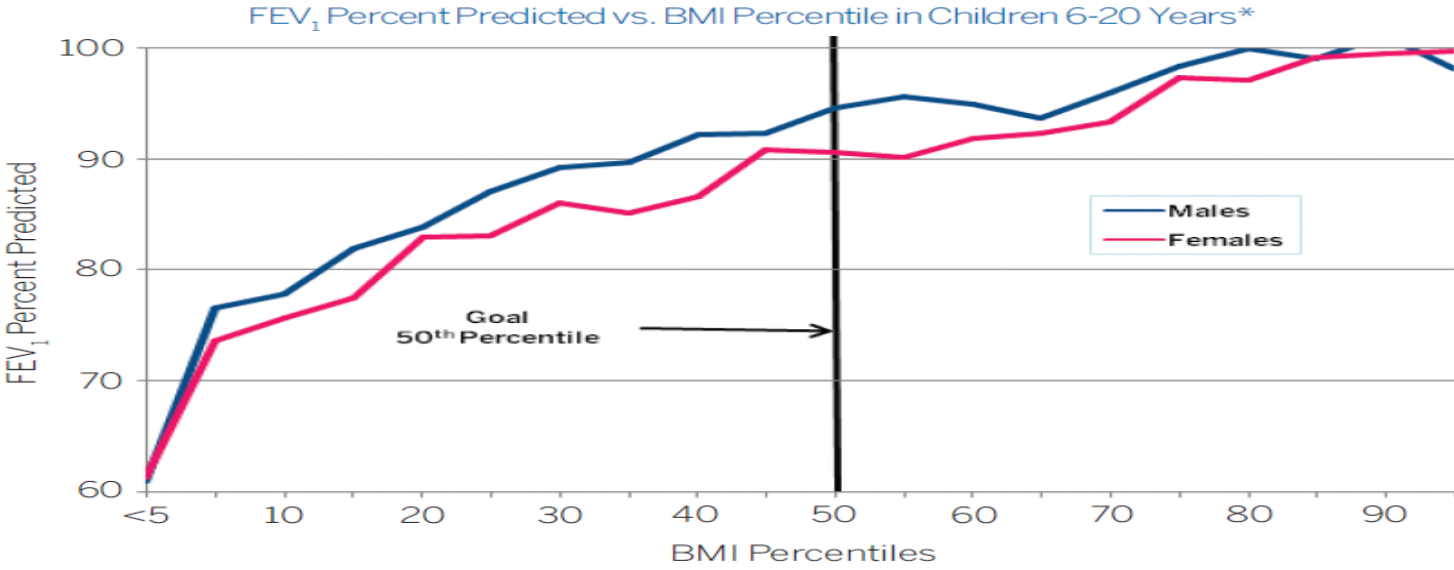

## Patient reported outcome

Nutrition and  
Quality of Life

## Patient experience

Experience of  
care

# Established clinical measures - BMI

# Advantages of reporting by BMI percentile and BMI

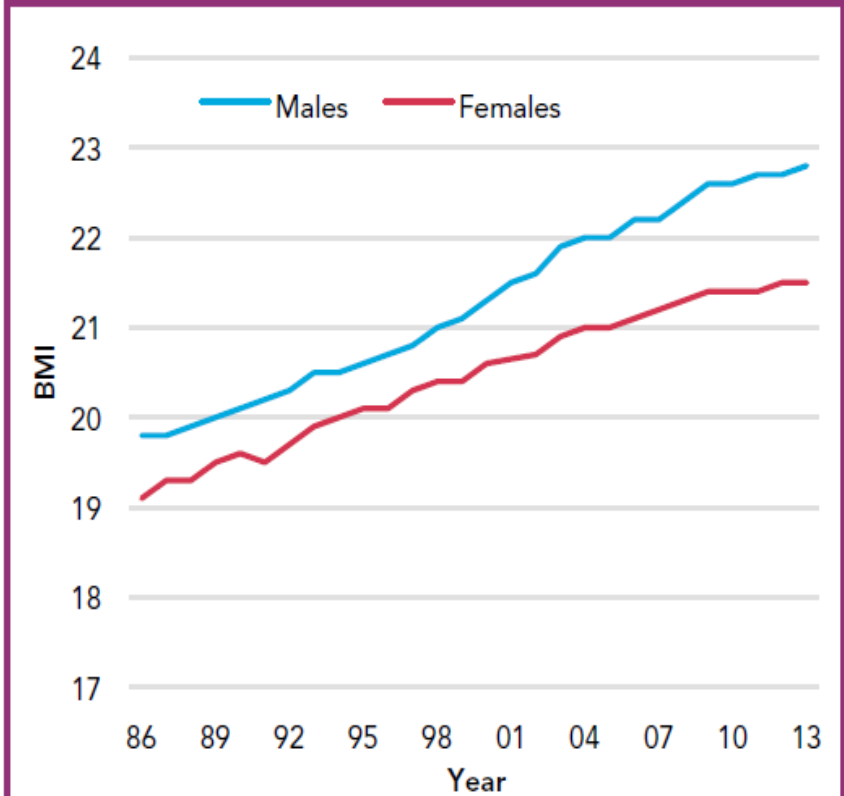

- Evidence based 50<sup>th</sup> percentile cut-off value based on its association with lung function
- Directly derived from data from the general population
- Superior to Ht/age and Wt/age
- More sensitive to changes in stature and age
- More sensitive to changes in FEV<sub>1</sub> than %IBW and had a stronger association to FEV<sub>1</sub> than %IBW
- Directly interchangeable with z-scores
- Forms a practical and sensitive measure for comparison and benchmarking
  
- [Weidemann et al 2007](#) German registry data confirmed
  - BMI as a more sensitive outcome measure
  - Close correlation of BMI percentile with wt/age percentile but not ht/age

# Longitudinal comparisons

Median Nutritional Outcome Percentiles for Patients 2 to 19 Years, 1986–2013

Median BMI Value for Patients 20 Years and Older, 1986–2013

# BMI Z-Scores (European CF Registry 2009 v 2010)

# BMI percentile - disadvantages

	Boys 2-18 years old		Girls 2-18 years old	
BMI Percentile	WFA <10%	HFA <10%	WFA <10%	HFA <10%
≥ 50	3.5%	21.6%	2.7%	19.3%
25 < 50	16.0%	27.2%	16.7%	25.9%
< 25	39.3%	31.3%	38.2%	29.7%

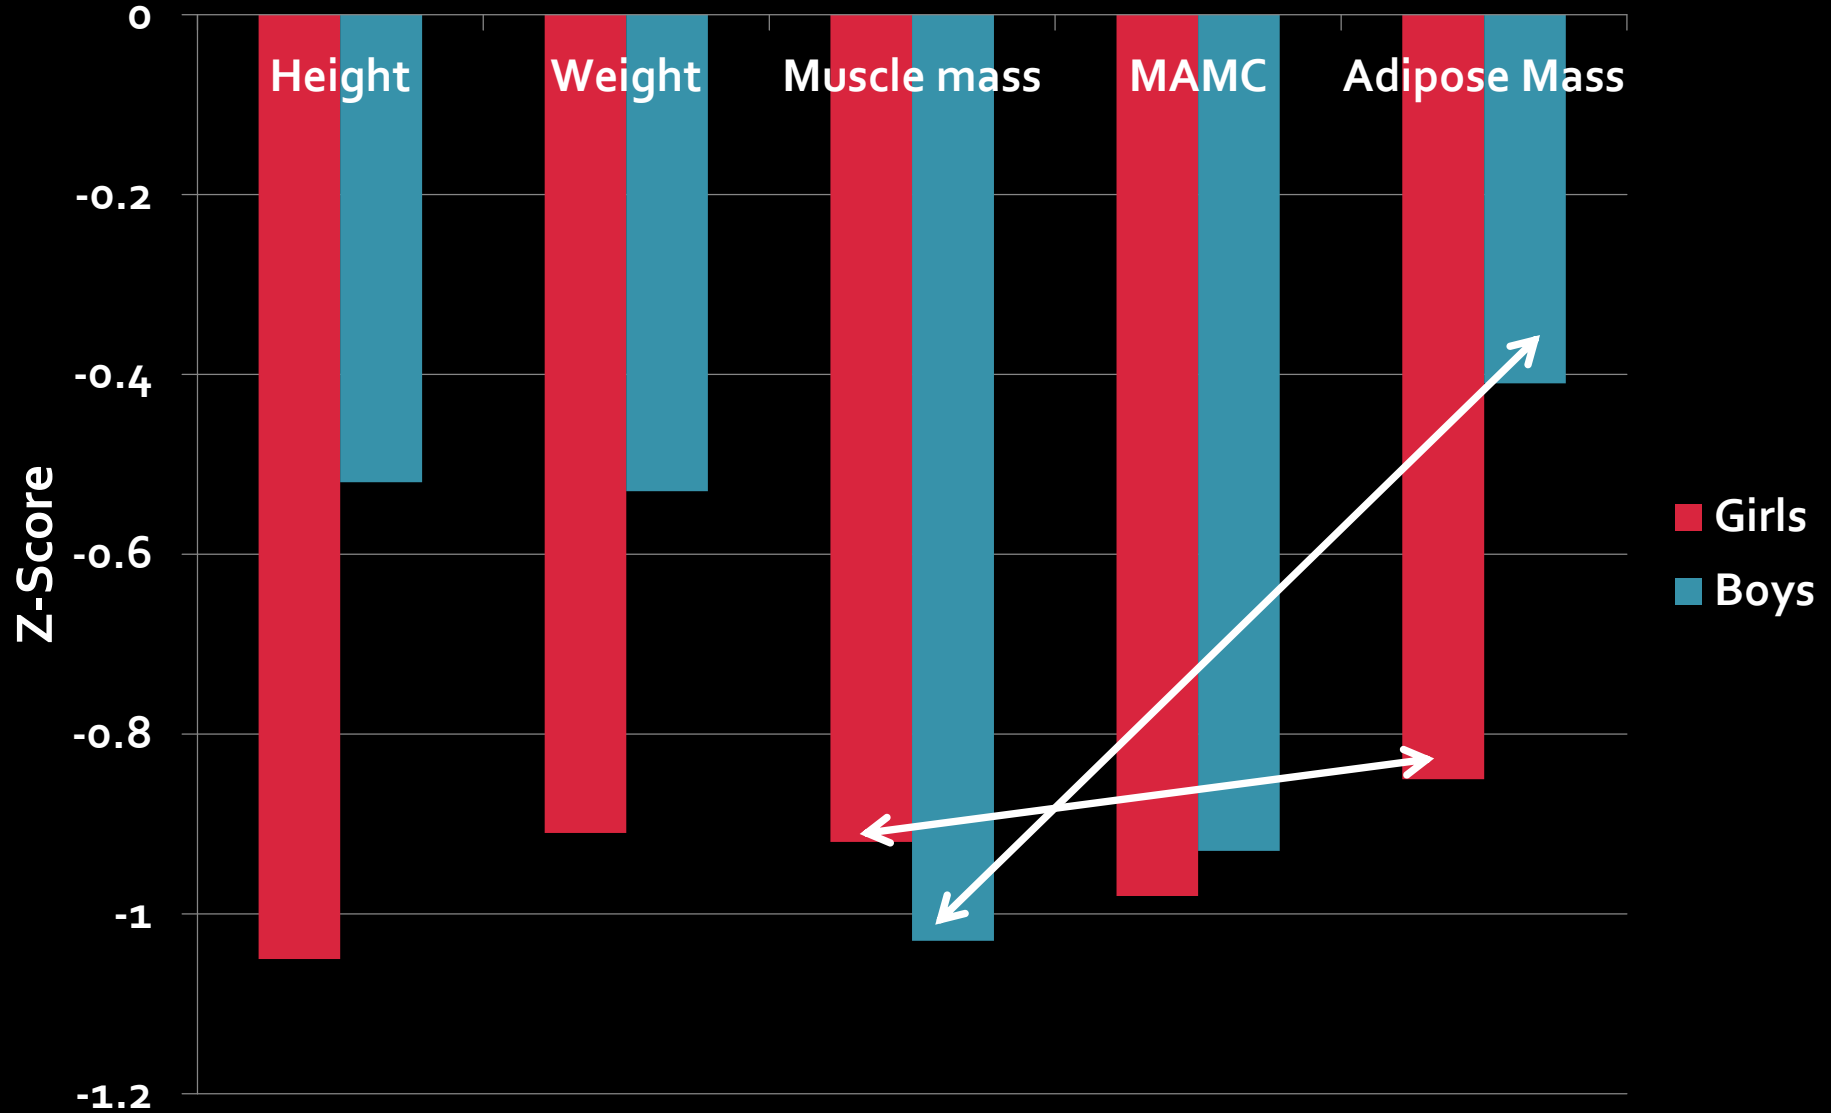

*Konstan et al., 2014*

- 1/5 of children with a BMI above the 50<sup>th</sup> centile had a height for age below the 10<sup>th</sup> centile
- As did 1/4 with BMI between the 25<sup>th</sup> and 50<sup>th</sup> centile

# Argument against use of BMI as a single outcome measure

- Changes in US - 1/3 centres changed by more than a tertile in rankings
- 2 of the best 5 centres on nutritional failure moved to the bottom tertile for below BMI goal
- Identified that using a single outcome measure can be misleading and that BMI goal outcome measure should not be the sole basis for making treatment decisions and identifying the best centres against which to benchmark best practice.
- **Other indicators** such as abnormal status of fat soluble vitamins should also be used
- Careful monitoring of the **processes of care** are also required

# Stapleton et al, 2001

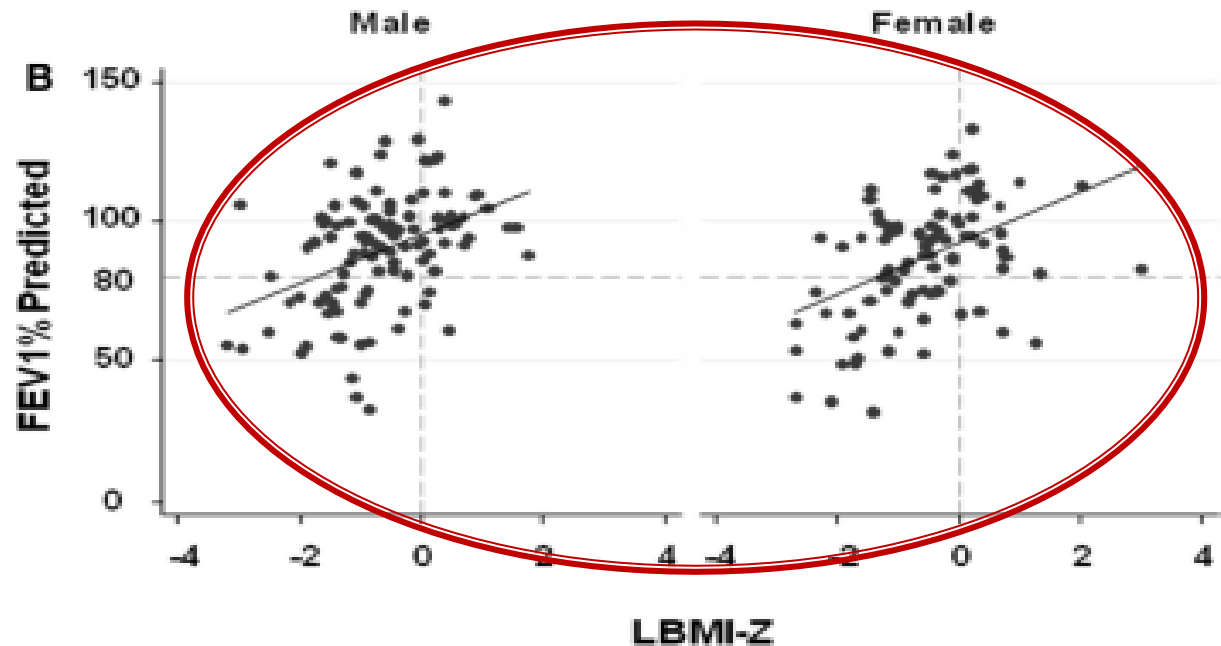

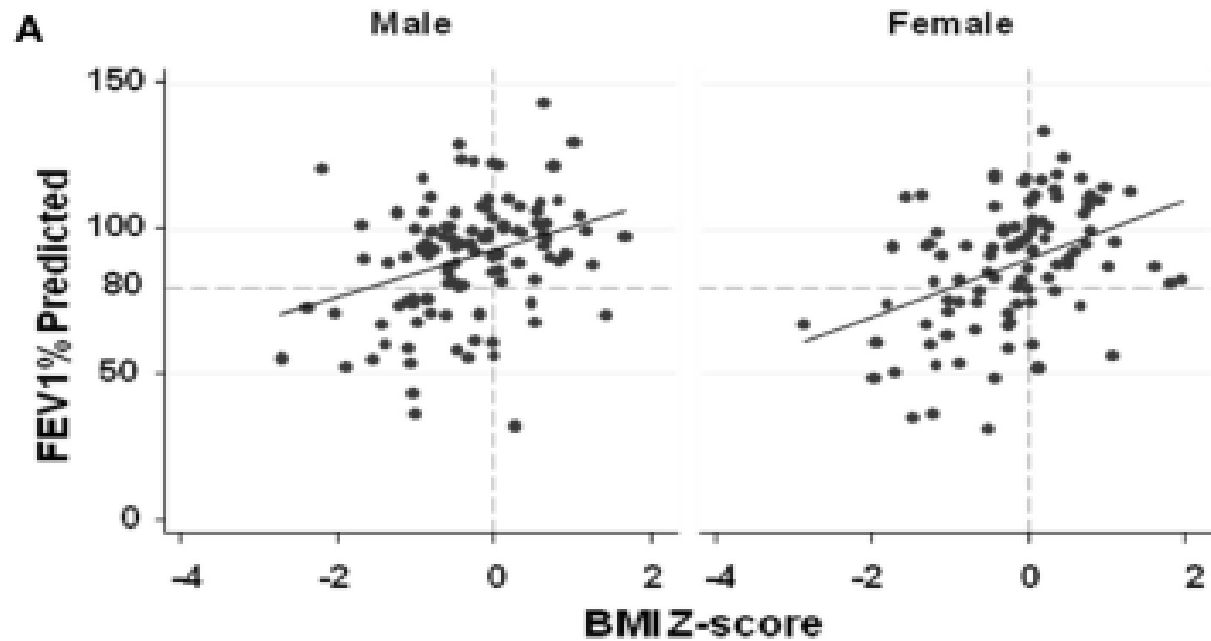

# Depletion of fat free mass

Studies	Age	Fat free mass depletion	BMI depletion	Association
Ahmed et al, 2004 (FFM)	10-16 yrs	7.6% girls 10.7 % boys		FEV <sub>1</sub> (boys only)
Reix et al, 2010 (LTM)	<6 yrs <10 yrs	12% 10%		Clinical status
Williams et al, 2010 (FFM)	6-12 yrs			Not associated with FEV <sub>1</sub>
King et al, 2010 (FFM)	Adults	14%	58%	FEV <sub>1</sub>
Ionescu et al, 2003 (FFM)	Adults	57%	40%	Disease severity Reduced BMD Systemic inflammation
Fogarty et al, 2011 (LBM)	Adults		-	FEV <sub>1</sub>
Rochat et al, 1994 (LBM)	Adults	66%	-	BMD
Hollander et al, 2014 (FFM)	Adults	60%	39%	Survival post Tx

Sheikh et al,  
2014

High likelihood of  
normal lung  
function, targeting  
BMI z-score  $> 0$

Improved further,  
by targeting LBM  
z-score  $> 0$

# Changes in lean tissue mass from pre to post-start enteral tube feeding

White et al., 2014

# How we assess lean tissue mass and fat free mass

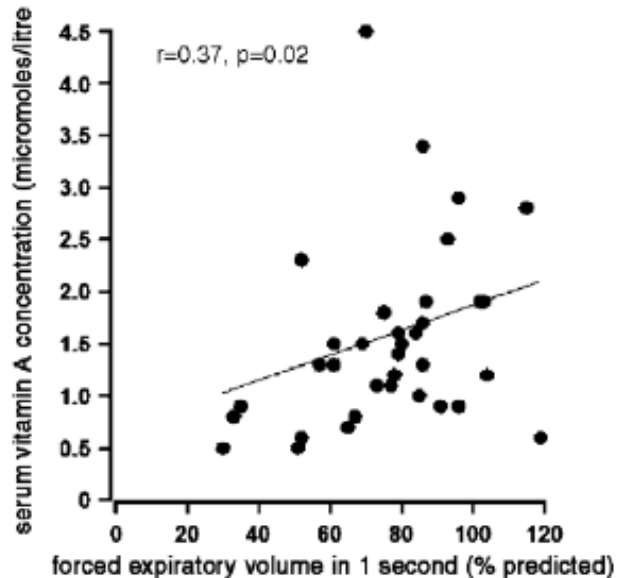

- Surrogate measures for nutritional outcomes for LTM
- Handgrip strength
- BIA
- DEXA

# Nutritional outcomes and vitamin and mineral status

- Calcium
  - Vitamin D
  - Vitamin A
  - Vitamin K
- 
- All have target levels and norms specified by current guidance

# Vitamin A and outcome

Aird et al. 2006

Carr et al. 1996

Vitamin A associated with CRP inflammation (Greer et al, 2003), pulmonary exacerbation (Duggan et al, 1996; LaGrange et al, 2004)

# Vitamin D and outcome

McAuley et al, 2014

Most studies have shown no association between Vitamin D and lung function

# Nutritional outcomes – and dietary recommendations

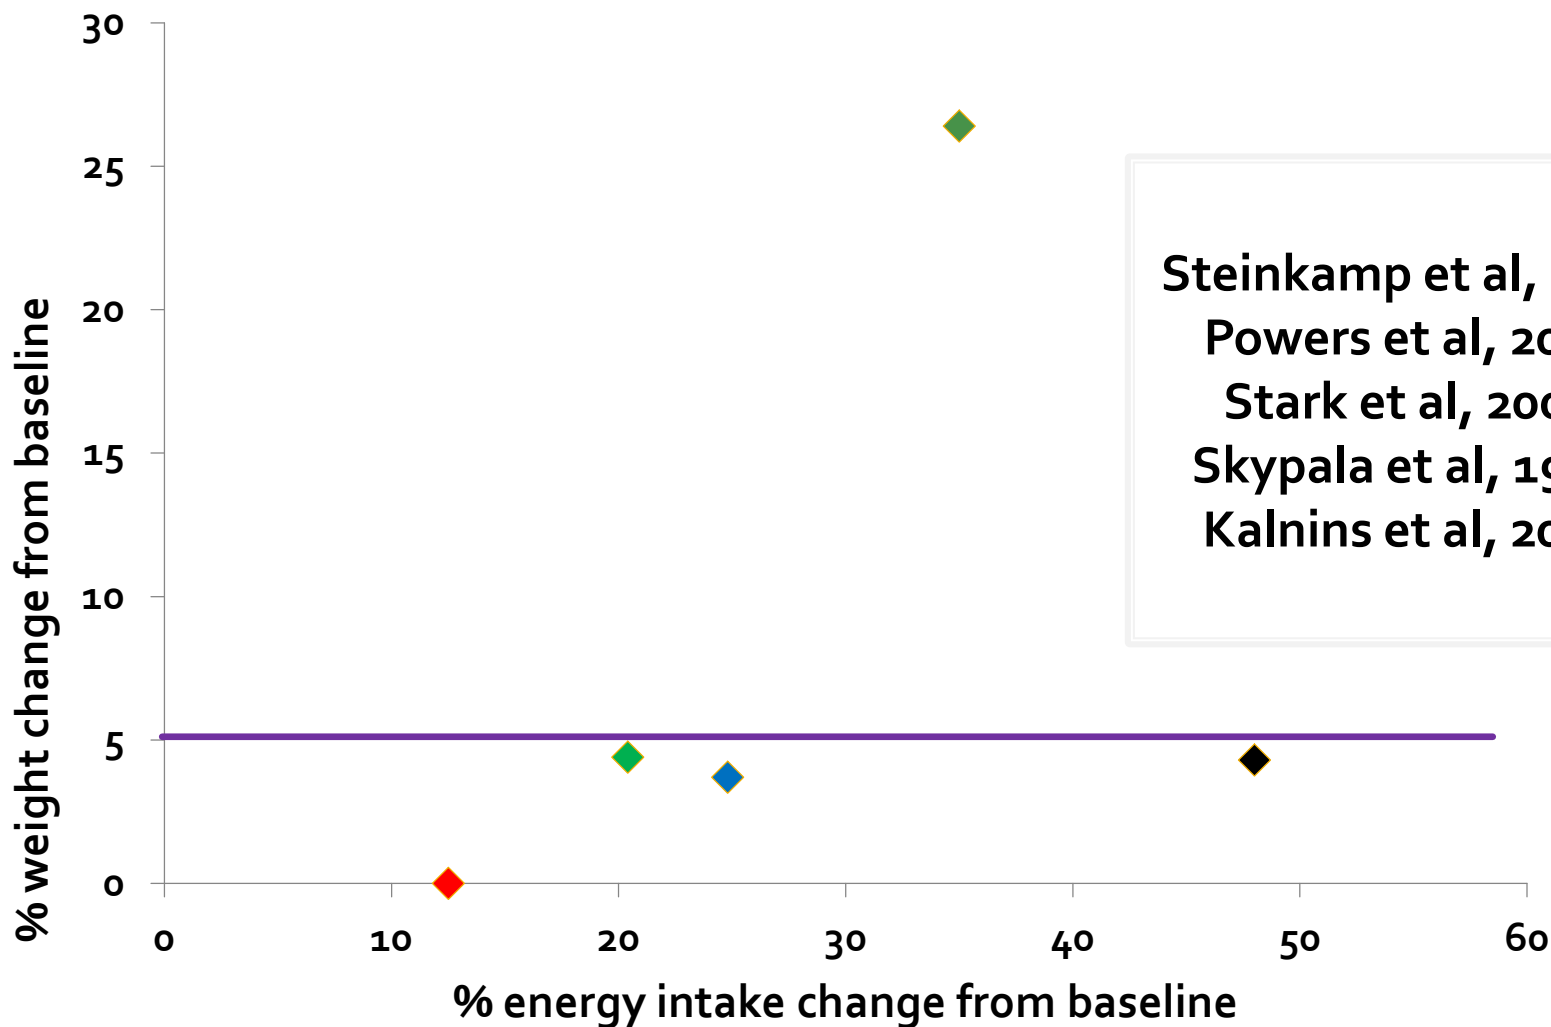

- Achievement of *minimum* of 110% EAR in pancreatic insufficiency
- Studies that have examined energy intakes before and after interventions have indicated consistent improvements in:-
  - Weight
  - Wt/age
  - %IBW
  - BMI z-score
  - BMI

# Hanning et al 1993

- Energy intake improved from 103% EAR to 122% EAR.
- Positively correlated with weight gain

# % energy intake change versus % weight change with nutritional interventions

Steinkamp et al, 2000  
Powers et al, 2003  
Stark et al, 2009  
Skypala et al, 1998  
Kalnins et al, 2005

# Calcium intake targets

Age	Intake
0-6 months	210mg
7-12 months	270mg
1-3 years	500mg
4-8 years	800mg
9-18 years	1300mg
19-50years	1000mg
>50 yrs	1200mg

Sermet-Gaudelus et al, 2011

# Calcium absorption

	Population	Pre puberty	Early puberty	Late puberty
Abrams & Stuff (1994)	Healthy children	27.7%	34.4%	25%
Shulze et al, 2003	Children with CF (clinically stable, well nourished)	26.7%	39.9%	29.8%

**Suggests that absorption is comparable to healthy children**

**Lower gut pH in CF may enhance calcium absorption**

# CFRD outcome - Screening

Rates of OGTT screening for CFRD have increased since the publication of the CF Foundation CFRD guidelines<sup>40</sup> in 2010.

# Moran et al, 2009

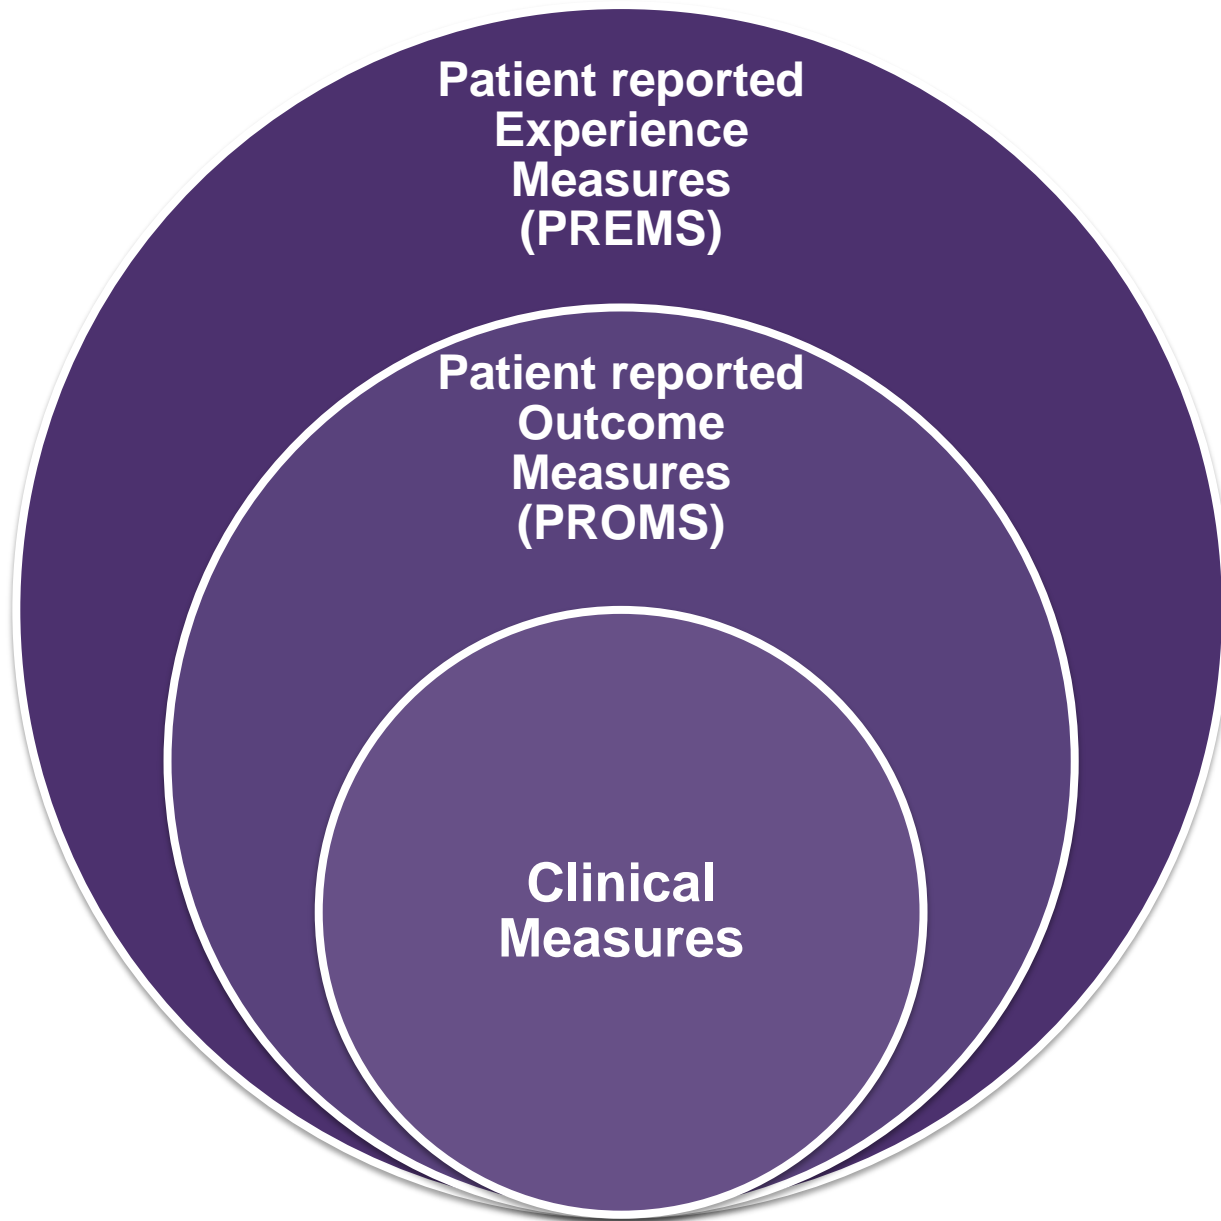

Diabetes Screening ?  
Improved disparities in mortality

# Cystic fibrosis related diabetes outcomes

- Evidence for target HbA<sub>1C</sub>?

Evidence	Nutritional outcome	Impact
Clinical Care Guidelines for Cystic fibrosis - related diabetes (Moran et al, 2010)	HbA <sub>1C</sub> <7.0%	to reduce microvascular complications
Sputum glucose and glycaemic control in CFRD: a cross-sectional study (Sambeek et al, 2015)	HbA <sub>1C</sub> <6.5%	to reduce pulmonary exacerbations

**Patient reported  
Experience  
Measures  
(PREMS)**

**Patient reported  
Outcome  
Measures  
(PROMS)**

**Clinical  
Measures**

# Nutrition and patient reported outcomes

Study	Nutritional indicator	Impact
Abbott et al, 2007	Enteral tube feeding	Poorer body image
Rufenacht et al, 2010	Nutrition Counselling	Improved nutrient intake and QoL
Schoff et al, 2013	Height and BMI	Positively associated with eating disturbance , physical function and body image
Abbott et al., 2015	Decreased BMI	Results in reduced body image HRQoL

Validated measures CFQ-R (Age specific) and CFQoL

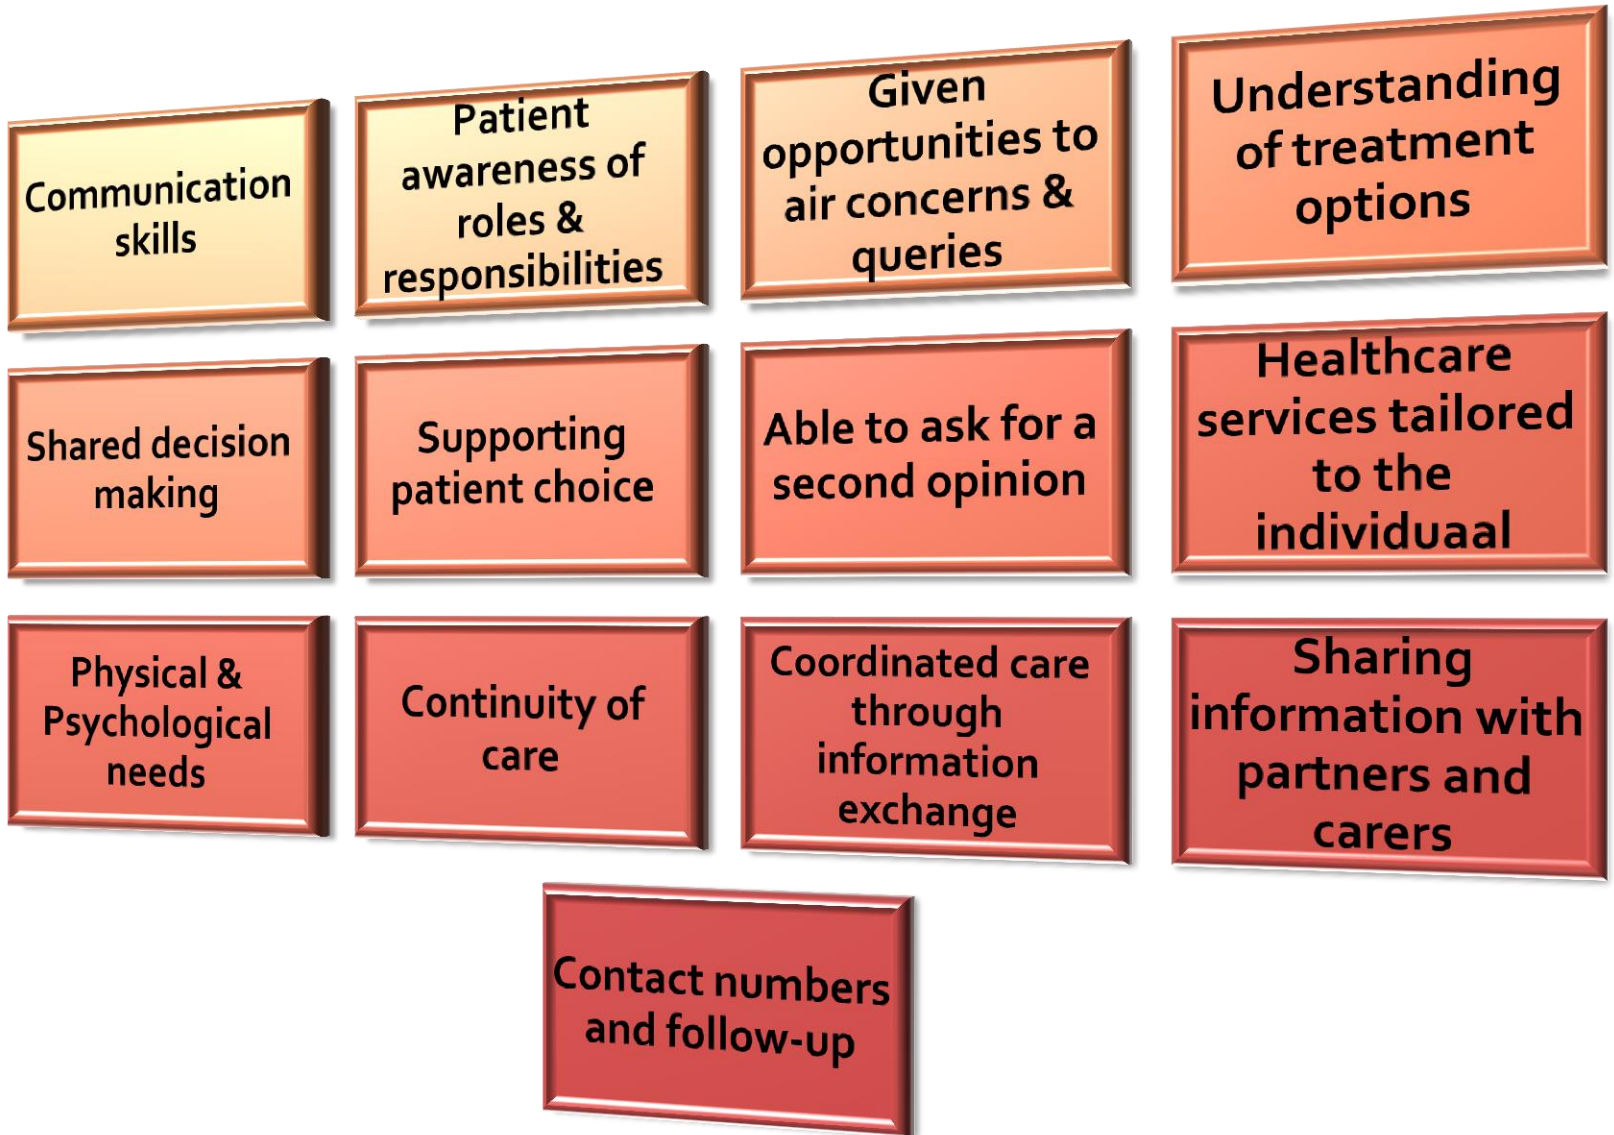

FDA (USA) and NICE (UK) advocate use in evaluating new treatments

# Practical and easy measures

- Digital era
- Exploration, validation & capture of simple, global, patient reported outcome measures
- European Medicines Agency (2012)

# Patient experience measures (NICE 2012)

# Patient experience in cystic fibrosis care: Development of a disease-specific questionnaire

# Gastrointestinal outcomes

Journal of Cystic Fibrosis 14 (2015) 169–177

Review

## Cystic fibrosis and the role of gastrointestinal outcome measures in the new era of therapeutic CFTR modulation ☆

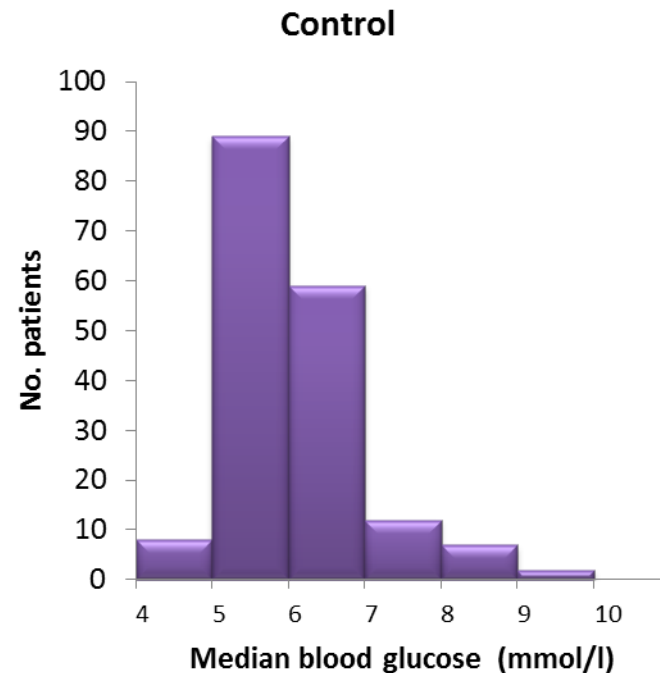

Frank A.J.A. Bodewes <sup>a,\*</sup>, Henkjan J. Verkade <sup>a</sup>, Jan A.J.M. Taminiau <sup>b</sup>,  
Drucy Borowitz <sup>c</sup>, Michael Wilschanski <sup>d</sup> Working group Cystic  
Fibrosis and Pancreatic Disease of the European Society for Paediatric  
Gastroenterology Hepatology and Nutrition (ESPGHAN)

Outcome measure	Applicable to	Validated
<b>BMI 50<sup>th</sup> percentile</b> <b>Weight percentile</b> <b>Height percentile</b>	<b>All children</b> <b>All children</b>	<b>Yes</b> <b>Yes</b> <b>Yes</b>
<b>BMI 22</b> <b>BMI 23</b> <b>Lean tissue mass</b>	<b>Women</b> <b>Men</b> <b>All</b>	<b>Yes</b> <b>Yes</b> <b>Yes (DEXA)</b>
<b>Minimum 110% EAR</b> <b>Calcium intake (target levels)</b>	<b>All</b> <b>All children and adults</b>	<b>Less robust</b>
<b>Vitamin A ,D, E,K level of</b> <b>30ng/ml</b>	<b>Children and adults with</b> <b>pancreatic insufficiency</b>	<b>Less robust</b>
<b>Diabetes</b>	<b>HbA<sub>1C</sub> &lt;7.0%)</b>	<b>Early stage</b>
<b>PRO (M) measures</b>	<b>All</b>	<b>Yes</b>
<b>PRE (M) measures</b>	<b>All</b>	<b>Early stage</b>

# Use of 'real time' data in outcome measurement

Distribution of the median Random capillary blood glucose levels over a 3 year period prior to diagnosis of CFRD

White et al, (2015) Variation in random capillary blood glucose and HbA1c as predictors of Cystic Fibrosis Related Diabetes (CFRD)

# The best nutritional outcome measures

- Practical, simple, validated
- Agreed reporting of measures
- Explain all aspects of nutritional delivery and outcome
  - Class mutation
  - Comorbidity
  - Socioeconomic status
  - Improvement from baseline

# Thank you
