A fully edited, peer-reviewed version of this article was first published by the *Canadian Journal for the Study of Adult Education*, 2021, Volume 33, Issue 1, pp35-50.

The aim of the Leeds Beckett Repository is to provide open access to our research, as required by funder policies and permitted by publishers and copyright law.

The Leeds Beckett repository holds a wide range of publications, each of which has been checked for copyright and the relevant embargo period has been applied by the Research Services team.

We operate on a standard take-down policy. If you are the author or publisher of an output and you would like it removed from the repository, please [contact us](#) and we will investigate on a case-by-case basis.

Each thesis in the repository has been cleared where necessary by the author for third party copyright. If you would like a thesis to be removed from the repository or believe there is an issue with copyright, please contact us on [openaccess@leedsbeckett.ac.uk](mailto:openaccess@leedsbeckett.ac.uk) and we will investigate on a case-by-case basis.

## **Abstract**

Coach Development Programmes (CDPs) are important, but significantly under-researched or understood, elements in the preparation of sport coaches. This paper draws upon the author's experience of carrying out five programme evaluations of CDPs in the United Kingdom. Each of the programme evaluations was based on an evaluation model that focused on relevance, fidelity, and intermediate outcomes; logic models incorporating each programme's intentions were devised and informed the evaluation. Evidence was gathered from interviews with participant coaches, coach developers, mentors, and other stakeholders, supplemented by questionnaires to coaches. Issues discussed include: the relevance and impact of particular delivery modes, the incorporation of coaches' practice, the enhancement of future capacity versus current performance, the emphasis on personal development and interpersonal skills, the degree of embeddedness in coaches' practice, and the degree of alignment between programme elements and personnel. The lessons learned have implications for similar mid-career adult education, both formal and non-formal, in Canada and more widely.

## Lessons learned from programme evaluations of Coach Development Programmes in the UK

### A need for programme evaluations

Education for sport coaches is normally delivered at a post-school stage and with a blend of formal certificated qualifications and non-formal experiential or workshop-type opportunities (Lyle & Cushion, 2017). There is a significant body of research that suggests sport coaches value initial certificated training, but learn much more from mediated experience and workshop-type programmes (Cushion, 2011; Lyle & Cushion, 2017; Morgan, Jones, Gilbourne, & Llewellyn, 2013; Purdy, 2018). Partly as a result of the perceived inadequacies of formal coach education programmes and recognition of the very varied educational experiences and qualifications of adult coaches, sport's regulatory bodies in the UK have established structured development programmes for experienced mid-career coaches. Over the past 10 years, I have conducted programme evaluations on five such coach development programmes. This paper offers reflections on the lessons learned from conducting these evaluations. There were a number of initial challenges to be overcome, including the absence of a suitable programme evaluation model, the absence of an extensive supporting literature on which to base expectations or comparative outcomes, and, in all cases, the invitation to evaluate the programmes was issued after the programmes had begun. An appropriate evaluation model was devised, but the evaluation options were limited to post-event studies.

Although there is recognition that coach education and development falls within the adult education domain (Mallett, 2011; Stodter & Cushion, 2019), the literature base that supports the evaluations is fairly modest, and fails to situate the findings within an appropriate appreciation of the purpose and scope of formal coach education and less-formal coach development (Lyle & Cushion, 2017; Mallett, Trudel, Lyle & Rynne, 2009). We might reasonably speculate that in an occupational grouping such as sport coaching with a fragmented and often limited professional preparation, post-experience coach development programmes assume a greater significance. The process of acculturation and occupational socialisation is eased by recruiting coaches from elite athletes in their sport, but this has potential limitations of taken-for-granted assumptions about practice and perhaps devaluing the development process (Blackett, Evans & Piggott, 2018). Put another way, the balance of formal and informal learning that is a constituent element of occupational socialisation and the development of expertise for coaches (Chambers, 2018) is tilted towards the informal in the case of performance coaches (Rynne & Mallett, 2014). Structured post-experience coach development programmes help to remedy that balance, in addition to their professional upskilling role for individuals.

The term coach development programme is used by Evans, McGuckin, Gainforth, Bruner and Côté (2015) in an all-embracing way to capture learning activities, but with assumptions about being focused on specific domains, and contrasts longer-term certification programmes with shorter-length non-formal interventions. In a follow-on paper, Lefebvre, Evans, Turnidge, Gainforth and Côté (2016) classified development programmes in sport coaching using domain forms (i.e., content) and organisational context. In a recent publication, Callary and Gearity (2020) adopt a similar conflation of

education and development to that expressed by the International Council for Coaching Excellence (ICCE, 2014), and an inclusive definition of a coach developer. This conflation is evident in the weighting given to tertiary education and formal certification courses (Callary & Gearity, 2019). In my view, these conceptualisations offer too broad a compass for coach developer training and coach development practice, losing, as they do, context, purpose and specificity for any lessons learned. For the purposes of this paper, coach development programmes are understood to refer to longer-term development programmes with an integrated package of learning activities, usually with a manifest emphasis on the coaches' practice, and most often directed to high-performance coaches. Canadian examples are Own the Podium's Coaching Enhancement Programme (<http://www.ownthepodium.org>) and the Coaching Association of Canada's Advanced Coaching Diploma (<http://coach.ca/advanced-coaching-diploma-s13778>). In the UK, typical examples are UK Sport's Elite Programme, Athlete to Coach programme, and the Elite Coaching Apprenticeship Programme (<https://www.uk sport.gov.uk/our-work/coaching>).

Such programmes are characterised by a multi-element series of formalised activities, including residential experiences, observation of experts, workshop programmes, and mentoring support, most often incorporating analyses of coaches' practice and interventions designed to address the coaches' particular needs. However, the key feature is an intention to embed the development programme in the individual coach's existing practice context, but with recognition of the role demands arising from a particular place within the coaching workforce. The programmes are generally orientated towards performance or high-performance coaching. These may be contrasted with research-purposed interventions or episodic workshops. Similarly, they are not normally part of the more limited Continuing Professional Development demands associated with re-validation of coach education qualifications (Nash, Sproule & Horton, 2017).

There was a very limited research base on which to scaffold an initial understanding of CDPs. Evaluations of coach development initiatives have tended to focus on research-led interventions, to be targeted on specific, largely interpersonal, aspects of coaches' behaviour, and to be centred on youth sport (Allan, Vierimaa, Gainforth & Côté, 2018; Evans, et al., 2015; Langan, Blake & Lonsdale, 2013). There are few, if any, reported evaluations of multi-element, large-scale programmes designed to enhance the effectiveness of the coach's practice and no critical analysis of findings in the context of coaches' practice or intervention parameters. There are a number of partially relevant prescriptions for 'good' practice in development initiatives (Araya, Bennie & O'Connor, 2015; Jones & Allison, 2014; Paquette & Trudel, 2018). In an earlier paper, Erickson, Bruner, MacDonald, and Côté (2008) acknowledged the idiosyncratic nature of coach development, but also found that coaches would prefer more guided and less self-directed learning. Sawiuk, Taylor and Groom (2017; 2018), having interviewed mentors on elite coach mentoring programmes in the UK, questioned the formalisation of outcomes and associated evaluation methods in mentoring. Despite recent welcome attention to diverse coach populations and to appropriate andragogical approaches to development (Callary & Gearity, 2019; 2020), the aggregated findings from this literature are too diverse to constitute a solid basis for evaluating the delivery of larger-scale CDP programmes.

There is, therefore, a fragile literature base within which evaluation findings might be contextualised. Unfortunately, the academic literature has paid little attention to coach development programmes as defined in this paper. Perhaps not surprisingly, the literature consists of retrospective accounts from high performance athletes about their learning

experiences and preferences (Walker, Thomas & Driska, 2018), and research-derived empirical studies, largely based in youth sport (Evans et al., 2015; Whitley, Massey, Camiré, et al. 2019). These studies reflect the relative ease of narrowly-focused research in comparison to *in situ* development programmes, and the methodological and reporting parameters of acceptable publication in academic journals. The challenges of impact evaluations of complex programmes are made evident by their absence.

### Conducting the evaluations

It was necessary to devise an appropriate programme evaluation model with which to conduct the evaluations. The model used had been devised by the author for a project for Sports Coach UK (Sports Coach UK, 2007). The model is outlined in Table 1. Following an extensive review of literature on programme evaluation, it became evident that the applicability and appropriateness of existing models were related to and restricted by the content and purpose for which their use was intended; the key driver was the purpose for which the evaluation was to be designed and implemented. In the context of coach learning and development, this meant favouring an improvement goal over that of accountability. There were convincing arguments in the literature that the myriad interactions within the programme should be emphasised, programme fidelity was essential evidence for programme evaluation, programme theory (e.g., logic models, theory-based evaluation) was a necessary stage in the process, working with ‘gross’ outcomes rather than ‘nett’ outcomes at the impact stage may be necessary (Chatterji, 2007), and procedures based on multi-method, pragmatic, and participant-based approaches were appropriate. It therefore emerged that an appropriate emphasis would be on the earlier stages of the evaluation process. In the absence of extensive longitudinal studies, the more distant ‘downstream’ outcomes are difficult to control, have many parallel influences (particularly in complex programmes), and are evidenced in gross effects other than nett effects (those outcomes resulting only from the coach development intervention).

*Table 1: Outline of the programme evaluation model on which the evaluations were based*

<p><b>Programme relevance</b></p> <p>Criteria</p>	<p><i>Establishment:</i> is the programme devised on sound theory; adhering to any regulatory guidelines?</p> <ul style="list-style-type: none"> <li>▪ relevance is evident to stakeholders</li> <li>▪ expertise and resourcing are available for implementation</li> <li>▪ forms part of a coherent evaluation strategy</li> <li>▪ the design of the programme has professional and academic legitimacy</li> <li>▪ evident adherence to good practice in coach development design</li> <li>▪ relevant to roles within the sport</li> <li>▪ programme objectives and evaluation themes identified</li> </ul>
<p><b>Programme fidelity</b></p> <p>Criteria</p>	<p><i>Intervention:</i> is the programme being delivered as intended, and to identified target audience?</p> <ul style="list-style-type: none"> <li>▪ the programme is being delivered as designed</li> <li>▪ the participant audience is as intended (practice, roles, athletes)</li> <li>▪ evidence that coaches are appropriately engaged</li> <li>▪ completion rates are acceptable</li> <li>▪ multi-site variability is acceptable</li> <li>▪ factors influencing fidelity are identified</li> </ul>

Programme <b>effectiveness</b>	<i>Output:</i> to what extent is the intervention creating the desired change in coaches' capacities?
Criteria	<ul style="list-style-type: none"> <li>▪ The programme activities provide appropriate learning opportunities</li> <li>▪ Adequate time for practice and reinforcement</li> <li>▪ Feedback and social support available from appropriate practitioners</li> <li>▪ The learning or change intended by the intervention has taken place</li> <li>▪ Mechanisms are in place to assess knowledge, skills, attitudes</li> <li>▪ Changes are evident in practice in the short/medium term</li> </ul>
Programme <b>transfer</b>	<i>Performance, Intermediate outcomes:</i> the practice of coaches within relevant roles reflects the changes derived from coach development
Criteria	<ul style="list-style-type: none"> <li>▪ The coach behaviours identified as outcomes of coach education are evident in sustained coaching practice</li> <li>▪ Coaches demonstrate the application of changed behaviour in a variety of contexts, circumstances</li> <li>▪ Coaches can relate their behaviour to athlete outcomes</li> </ul>
Strategic <b>impact</b>	<i>Longer term outcomes:</i> the extent to which changed coaching practice has impacted on desired sporting indices
Criteria	<ul style="list-style-type: none"> <li>▪ Measurements of sporting indicators (standards, numbers, quality, achievement) are increasing</li> <li>▪ Coaching learning and development established as a norm in the professional development of coaches</li> </ul>

Each of the evaluations was commissioned research for sport regulatory bodies in the UK. While acknowledging the tensions deriving from such research (Livingston, 2017; Richter & Hostettler, 2015), the evaluations were carried out in a robust manner, and with a common conceptual basis. The author has been a central figure in the emergence of sport coaching as a legitimate area for academic study, both in extensive publications and in the development of tertiary education programmes in the UK (Lyle, 2017). He has also conducted over 60 sport and coach education and development projects for national sporting organisations, including 16 programme evaluations. He is therefore well placed to conduct such evaluations and to aggregate and synthesise their collective findings.

Table 2 provides a brief overview of each of the CDPs on which the evaluations were conducted.

*Table 2: Outline of Coach Development Programmes*

<b>Programme</b>	<b>Descriptor</b>	<b>Development activities</b>
1&2	A 1-2-1 intervention programme for high-performance coaches from four sports who are preparing athletes for a major event.	Face-to-face with expert facilitator; generic and sport-specific professional practice-related workshops; additional resources/opportunities provided.
3	‘Emerging’ coaches from 6 sports, working in the high-performance system, but with limited coaching experience; 2-year period.	Residential workshop programme; apprenticed to a master coach; peer and mentor support.
4&5	Full-time Olympic programme coaches across 8 sports, involving over 50 high-performance coaches.	Community of Practice; breakfast clubs/workshops; 1:2:1 interaction with a mentor; observation and analysis of practice; individualised

programmes (apprenticeships, Higher Education courses, conferences).

**Method**

The evidence to populate each evaluation was garnered from documentary analysis, interviews with relevant stakeholders, and questionnaires to participating coaches. From initial discussions with programme managers and the scrutiny of associated documentation, logic models were created for each evaluation; these were based on the evaluation model and populated with that programme’s particular characteristics. The ‘focus points’ and issues to arise from this modelling were then used to guide the evidence required and the substance of the questionnaires and interviews. A total of 68 interviews were conducted across the five development programmes and additional narrative feedback was received from 48 coaches. Although some quantitative responses had been obtained from the questionnaires, the open-ended responses provided a rich source of helpful participant insights into context and issues.

*Table 3: Summary of interviews and procedures conducted*

	<b>Prog 1</b>	<b>Prog 2</b>	<b>Prog 3</b>	<b>Prog 4</b>	<b>Prog 5</b>
Programme Manager	1	1	1	1	1
Programme Developers	1	1	3	5	5
Coaches	5	8	9		
Mentors			4		
Head/Master Coaches			3		4
Performance Directors			2	5	8
Coach questionnaires			9/12	15/18	15/36
Written feedback				9	

The interview themes were specific to the issues identified in the logic model, to the concerns of the programme managers, and to the roles of the interviewees (See Table 4 for an example). There was also an attempt to focus on more general development principles and, in the context of an improvement agenda, to identify perceived but remediable shortcomings.

*Table 4: Sample interview frameworks*

**Coach Developers**

Describe your approach to development. How have you adapted it for this programme?

To what extent have the objectives identified for the programme been achieved?

How was the programme evaluated? Is there any documented evidence?

To what extent was the programme delivered as intended?

Was the intention of the programme adequately explained by the programme lead?

Have individual coaches engaged with the programme as you would have intended?

What were the barriers to implementation?

What has worked well; what has worked less well?

Have you identified any overall future needs that have become evident?

### **Performance Directors**

Overall views on the success (or otherwise) of the programme  
To what extent was there a 'legacy' impact on coach development  
What were the barriers to successful implementation?  
What changes/improvements would you make to the programme?  
Review the objectives set for the programme  
Have all coaches taken part as you would have expected? If not, why not  
How does this programme fit in with other developmental programmes?  
Were you satisfied with the expertise of the deliverers?  
Have you evaluated the programme? What were your criteria?  
Do you perceive any impacts on coach performance at this stage?

### **Head Coaches**

Were you actively involved in the programme? Describe your involvement  
Overall views on the success (or otherwise) of the programme  
Comment on the appropriateness of the programme content to coaches' roles  
What parts of it were most (and least) useful?  
Is it your view that coaching practice has changed as a result? What evidence do you have?  
How could it have been structured differently?  
What were your views of the 'coach developers' used for your programme?

The evidence gathered from each evaluation was subjected to a thematic analysis, within a framework based on the evaluation model (e.g., relevance, fidelity, outputs), generic issues (e.g., personnel, resources, organisation), and specific issues expressed by programme managers. The latter tended to be programme specific, and arose from concerns over, for example, role/impact, sustainability of change and coach engagement. Each evaluation produced a substantial report and a summary set of recommendations. Although this body of work provides rich evidence of the programmes in operation and nuanced insights into the programmes, this paper must necessarily be selective. Its purpose is to provide a synthesis of the overall findings, using generic themes that are judged to be helpful and transferable to similar adult education programmes.

### **Personal reflections and lessons learned**

The evaluations resulted in a body of evidence and experience from which it is possible to synthesise the features perceived to have contributed to successful or less-successful coach development practice, as perceived by the participants and the sport's programme directors and on the evidence of changes in practice. It is important to appreciate two background factors in reflecting on the findings and considering the implications for adult education programmes. First, the majority of the participants had existing, usually intensive, coaching commitments on which interventions could be based, or which could provide a reference point for reflection and application (indeed, this was an assumption across the programmes). Second, as the term 'programme' implies, these were multi-element, often multi-deliverer, programmes in which there was a combination of organisational and personal goals. Although each of the coaches involved could be treated, and evaluated, as

individual cases, there was also a programme-level ambition, design and delivery that formed part of the evaluations.

### ***Variability and control***

Programme Managers attempted to balance the achievement of organisational goals with flexibility, context specificity, and individualisation. Development programmes, therefore, have an issue of 'control of the intervention'. Where, for example, programmes are relying on mentor or master coach partnerships with coaches, it is important to ensure, through regular monitoring, that suitable relationships have been put in place and are functioning appropriately. Individual coach outcomes are based on improvements in personal practice, not on pre-determined measure of acceptable or desirable practice. The workshop programmes can be 'controlled' (implying 'assured delivery') and therefore tend to be well organised and delivered. Non-contextualised training can be 'controlled', and this again refers to the workshop programmes. In the context of these evaluations, a danger emerges in which programme managers emphasise 'what can be controlled', but the difficult (perhaps crucial) practice-based elements - dynamic, complex relationships and priorities between facilitators, mentors, coaches, master coaches, objectives and the demands of the coach's role - are less controlled and controllable. This has implications for monitoring procedures, and for managing and evaluating appropriate programme inputs.

### ***Clarifying programme goals***

The absence of clear expectations for these coach development programmes was a limiting factor in evaluations. Process evaluation of programme fidelity (how they had been conducted) identified some limitations in the way that programmes had been delivered, but issues about scheduling, organisational commitment, reporting and adherence could be relatively easily remedied. However, outcome evaluations were limited by the absence of clear statements of expectations against which outcomes could be judged. For example, had programme objectives stated that coaches should be 'more confident and understand their strengths and weaknesses better', then the evaluation of outcomes was relatively straightforward. However, an understandable expectation that coaches' practice in relation to athlete preparation and performance should be 'better', in a number of identifiable ways, is perhaps a much more relevant and desirable outcome, but is a more challenging prospect for developers, programme managers and evaluators.

Adult education deals with myriad ambitions from basic education and training to extension of professional capacity. Achieving balance between broad programme aims and context-specific behaviour change is a difficult exercise, particularly in situations in which evaluation of impact is based on third party performance (athletes, pupils, patients, learners), rather than the programme participants' personal qualities. It is important, therefore, that programme goals are clear and accountable.

### ***The importance of practice as a reference point***

There was a very clear intention that the coach's practice should be the constant reference point for coach development programmes. This would seem to be an important feature of mid-career practitioner education, as opposed to initial training. Given the contextual

particularity of practice, this meant that individualised and one-to-one intervention activity was preferable. Coaches valued observation and analysis of their practice and wished to have mentors who could comment knowledgeably on their practice. Coaches wanted more informed observation of their practice, with associated feedback, and a particular video-feedback project providing evidence-based feedback and analysis was very well received. This further emphasised the qualities of trust and credibility in mentors, enabling critical analyses of practice to be generated as learning catalysts. It was often the case, particularly in workshop or group meetings, that the coaches' practice was mooted as a focus, but the presentation was not directly related to individuals' circumstances, and application was often left to the coaches. This also highlighted the problematic issue of subsequent 'follow up' or reinforcement of interventions.

### ***Developers and mentors***

Considerable emphasis was placed on the perceived quality of the coach developers and mentors involved in the programmes by interviewees. The coach developers who led the programme interventions were generally well respected, albeit with distinctive approaches to their roles. Nevertheless, a common approach was evident in which conversation and/or analysis, along with the coach's self-reflection, was employed to identify priorities for development. Coach developers thereafter introduced ideas or supporting materials to improve practice, acting as mentors or relying on other mentors for reinforcement. Mentors could be classified in two categories: either advisers and sounding boards or learning support mentors, the latter having less direct involvement with the participant's practice but ensuring adherence, completion of learning tasks and monitoring of progress. Each had a role to play but it was important for programme managers to ensure that mentors were exercising the anticipated and appropriate role. Where mentors acted as 'sounding boards', an external mentor who was not associated with the participant coach's organisation or employment was an advantage. This created a safe, risk-free, neutral relationship in which the coach could explore relationships and practice. The second type of mentor, the learning support mentor, normally evidenced a more structured intervention and played the role of reinforcing the interventions of the coach developer. In one-to-one relationships, of course, the roles of developer and mentor were most often combined.

The crucial role of developers and mentors highlighted the need to ensure that there was a sound working relationship with the coach. It was important that they were compatible, and programmes in which coaches had a choice of developer and/or mentor reduced the need for changes of personnel. Professional expertise was generally valued above internal volunteers from within the sport, despite evidence of mentor training for the latter. Coaches valued mentors who had empathy for and insight into their particular coaching role and circumstances, and who were able to offer informed opinions about their practice – and were able to challenge coaches' practice in relation to progression, climate and learning. The key factor was a positive alignment between the personnel, the coach's needs and goals, and the goals of the development programme. This was not always evident in the evaluations. From the comments of coaches, an effective coach-master coach relationship is more likely when they come from the same discipline within their sport, operate largely in the same location, have an existing relationship, there is evident commitment from the master coach, a structured intervention process, and a shared understanding about intended development goals.

### ***Delivery structure and programme goals***

The particular emphasis within development programmes tended to highlight the differences between one-to-one development and workshop-type programmes. This is underpinned by a distinction between capacity and performance; capacity is a generalised expertise, which is developed in the practitioner and can be called upon or applied when and as necessary. Performance refers to the application of expertise to a particular athlete or athletes and in a particular context and set of circumstances. Coach development programmes that are couched in ‘personal development’ terms are generally directed to the former (that is, generic capacity). This is evident in workshop programmes based on what might be termed ‘facilitating elements’ of practice, including examples such as reflective practice, problem solving, conflict resolution or coaching philosophies. In the evaluations conducted, coaches reported that they were aware of the challenge for workshop presenters in demonstrating relevance and applicability on such occasions.

On the other hand, one-to-one interventions were more likely to focus on core elements of the coaching process – planning, competition management, skill development, tactical decision making, and so on. The important message is that development programmes should, at some stage, include coaches and athletes operating in their usual environment (and this would apply to other adult practitioners). In the evaluations conducted, there was very limited attention to sport-specific ‘technical’ elements of expertise and a much greater emphasis on interpersonal relationships. In the one-to-one programmes, this may well have been identified as the most significant area for development (and this may be understandable in high performance sport). Workshop programmes also focused largely on interpersonal relationships and personal development, but it is not clear if this was an identifiable and generalisable need or intended to be complementary to other practice-based elements.

Workshops are a ubiquitous element in adult education (de Grip & Pleijers, 2019) and serve a particular purpose in raising awareness, orientating attention or transmitting information. However, the often one-off nature of workshops and the difficulty of individualising practice-related feedback explains why workshops are often directed to generic and facilitating elements of performance. In these evaluations, programme managers viewed the workshop programmes as an opportunity for practitioners to be made aware of recent developments in the field and to engage with experts. They acknowledged that there was often limited immediate applicability to practitioners’ practice.

### ***Development models***

Evaluations identified the need for clear and, to some extent consensual among deliverers, models of both development and coaching expertise with which to underpin programmes. The need was based, not on a desire to impose or regulate approaches to development, but to understand the implications of different approaches across multi-deliverer programmes. Coach developers will have different ways of facilitating learning and development. It is likely that the social element in learning, the role of feedback, the means of consolidating and reinforcing learning, and building on previous learning will be subject to an emergent blend of theory and practice for each developer. This variety is perhaps to be welcomed, but its assumptions should be made clear as this impacts the structuring of interventions and

the follow up by mentors. There were instances in which learning was assumed to be taking place (for example, within 'apprenticeship' relationships, or observation of experts), but without any specific responsibility on the expert or mediation of the learning by other mentors. It was a similar picture with interpretations of coaching expertise. It did seem likely that alignment of objectives, resources, activity and priorities would be eased somewhat by a clearly stated approach to coaches' expertise and its development. In each of these cases - development and expertise - there was no suggestion that there was a right and wrong approach; merely that clear statements about each were an important part of programme design, forming a basis for a shared language, understanding needs, facilitating communication, feedback, managing expectations about impact, and illustrating possibilities for change.

The rationale for each programme was that enhanced coaching expertise would impact positively on the quality of the coaching on offer and result in a situation in which the athlete's performance was more likely to be maximised. The factors that influence athlete performance are too complex to single out particular instances of specific coach development being a factor in improved athlete performance. Nevertheless, there were many instances of a sport's performance director identifying perceived weaknesses in coaching performance that had been remedied. The question of impact was one that overshadowed each evaluation. In the absence of longitudinal studies, it was not possible to make strong statements about sustained improvements in practice. Coaches gave guarded responses about sustained changes to practice but were almost unanimous that they had benefited from the interventions and could identify improvements in their personal development or coaching expertise. Although there were many examples of specific technical or process insights into coaching practice, benefits centred on the opportunity for guided reflection and informed feedback on individuals' practice.

### ***Creating a positive learning environment***

There were a number of features of intervention delivery and structure that were identified by the evaluations as significant for facilitating positive learning and development. There was a very strong message that the social element in interventions is valued very highly. Within workshop programmes, the social interaction outwith the formal programme was a time for coaching-related interchange and building networks. In less-formal settings, coaches valued 'breakfast clubs' or meeting as small groups. This was partly to share ideas, but also to receive some validation of practice through peer evaluation. Although the term 'community of practice' was used in programme documentation, these occasions were more likely to produce small, active networks of coaches than true communities of practice. It was also the case that coaches preferred a structured series of interventions, perhaps despite, or because of, their busy schedules. There was some evidence of 'programme drift', where there was a less intensive or structured programme.

Although there was an ethos of self-direction and critical questioning by coaches as part of developers' approaches to learning, it was also clear that coaches valued a sense of 'direction' from developers and mentors. Coaches were comfortable with a guided learning approach but, when based on an informed insight into their practice, wished to have more direction. This may have been more evident in the less-experienced coaches. Another strong reaction from coaches was to the issue of 'follow up'. This was less evident in one-to-one partnerships, but in workshop programmes, for example, coaches felt that ideas were

presented to them, often by visiting ‘external experts’, with limited, if any, subsequent follow up. Workshop presenters may engage in exercises to familiarise coaches with their ideas, but this was a very limited means of translation into practice. In some programmes, it was intended that mentors would reinforce these messages, but there was evidence of poor practice in this kind of learning support. The notion that coaches on development programmes would be revisited at the end of the interventions for some form of summary performance evaluation did not arise.

Participation by coaches was normally on a voluntary basis; coaches were able to make judgements about the anticipated benefit of the programme. However, there were a number of coaches for whom participation was a required part of their contracts. This produced some variable ‘buy in’ to the programme. The factors at play in these instances were age, attitude to collective activity, previous lack of development opportunity, previous poor experiences, different short- and long-term perspectives, internal competition, and perceptions of ‘what’s in it for me’. For these coaches, and, indeed, for all others, a needs analysis was a necessary first step in helping to identify development priorities. This was more appreciated when it involved observation of practice, but it was also important to present this as a self appraisal rather than external evaluation. Typically, this led to a personal development plan. It was relatively rare for this to be used as an active instrument of development, and there was potential for it to be used more productively.

The principle of ‘embeddedness’ was one that arose across the programmes. This referred to the extent that coach developers were either isolated from or integral parts of the sport’s coaching activities (remembering that on the majority of occasions the coaches were working with some of the best athletes in the sport). It was rare for developers to work entirely at-arms-length from the sport’s infrastructure, but it was also rare for developers to be completely integrated. For this to happen, developers would be present at coaching strategy meetings, active players in strategy formulation, in communication with performance directors and head coaches, and aware of objectives and policy on athlete selection and progression. In practice, developers held a middle position. Nevertheless, there was very strong support for an element of embeddedness, particularly with one-to-one and small group development activity.

### **Summary and recommendations**

The scope of adult education is wide-reaching and reflects policy imperatives on issues such as adult literacy, workforce mobility, health and wellbeing and social and cultural integration (Rubenson & Elfert, 2015; 2019). Coach education and development in sport is one field that has not traditionally been conceptualised within the adult education domain, although the programmes are designed for an adult population with varying previous educational experience, are post-experience and combine employment with an additional mediated learning experiences, and adult learning principles are well established in its practice (Cushion et al., 2007; Race, 2014). Nevertheless, the lessons learned from the evaluation of the coach development programmes in this paper have a wider application. This applies to mid-career workplace learning (Fergusson, Allred & Dux, 2018), in which organisations are unable to provide experienced practitioners with sufficient individualised development opportunities for career enhancement and have recourse to external development programmes. This may be characteristic of the voluntary and leisure sector, but, more generally, the good practice described in this paper will have particular resonance

for mid-career practitioner development in occupations in which formal entry qualifications are acknowledged to provide limited domain-specific extension of professional expertise.

Of course, the UK programmes that provide the basis for this paper are similar to advanced coaching development programmes that are in place across the globe (Callary, Culver, Werthner & Bales, 2014); these may be certificated or non-certificated but exhibit similar characteristics. Trudel, Culver and Richard (2016) comment on the similarities between Canada and others in the 'global village'. Callary et al. (2014) examined programmes in Canada, France, Germany, Netherlands, New Zealand and Switzerland. They identified common characteristics of experiential learning, mentoring, peer support, and on-going deployment. These programmes also mirror the characteristics of the higher levels of formal certificated programmes, but are relevant in countries and systems in which there is significant investment in elite-level sport - particularly Olympic sport – in which appointments are rarely based solely, if at all, on formal qualifications. Coach development programmes are viewed as a mechanism for ensuring a level of accountability of expertise for coaches who may have been recruited in an accelerated fashion into senior posts.

Canada provides examples of coach development programmes whose similarity to the programmes reported in this paper emphasise the generality and applicability of the implementation lessons that emerged. The Coaching Association of Canada's Advanced Coaching Diploma is described as an 'adult learning experience' (see <http://coach.ca/advanced-coaching-diploma-s13778>). It is an extended multi-sport programme with peer support, mentoring, multiple delivery modes and a structured learning community. Another non-certificated programme in Canadian sport is Own the Podium's Coaching Enhancement Programme (see <http://www.ownthepodium.org>). Own the Podium was established to ensure adequate levels of support for Team Canada's high-performance Olympic athletes. The Coaching Enhancement Programme is an 'upskilling' programme and is concerned to ensure that the 'quality of the development experience is very high'. The programme has flexible development options, an intensive short programme, a workshop programme, and mentoring and peer support. These examples serve to demonstrate that the lessons learned from the evaluations in this paper have a much wider resonance.

Based on this experience of evaluating coach development programmes, and reflecting on both singular and aggregated findings, it is recommended that particular attention should be paid to (a) the strategic role of programmes, in relation to purpose, role, expertise, complementary qualifications and targeted developmental pathways; (b) placing the practitioner's practice at the heart of interventions; (c) coach developers operating with an element of embeddedness within the sport; (d) alignment of purpose between developers, mentors, programme managers, performance directors and coaching directors; and (e) clearly stated learning outcomes. With the benefit of experience, evaluation strategies for individual programmes should have an emphasis on robust rationales and closely monitored fidelity of delivery. This can be sited within a more strategic periodic evaluation of effective coaching and a cumulative assessment of coaching workforce capital within sports.

The evidence from the evaluations conducted on these coach development programmes suggests that effective programmes were characterised by strong practitioner commitment, purposeful facilitation, structured engagement in practice, timely feedback and reinforcement, and social scaffolding. Well-received programmes were needs-led, role specific and individualised. There was a place for both workshop programmes and one-to-

one evidence-based interventions, each of which are complemented by a social dimension in which informal peer support was important. It is crucial that the learning expectations from all elements of the programmes are clearly stated and understood by all concerned. Although derived from a specific educational and developmental context, the evaluations have provided insights into features of good practice in adult education that can be applied to the sport system in Canada, but also more widely to mid-career educational development programmes in other spheres.
