The aim of the Leeds Beckett Repository is to provide open access to our research, as required by funder policies and permitted by publishers and copyright law.

The Leeds Beckett repository holds a wide range of publications, each of which has been checked for copyright and the relevant embargo period has been applied by the Research Services team.

We operate on a standard take-down policy. If you are the author or publisher of an output and you would like it removed from the repository, please [contact us](#) and we will investigate on a case-by-case basis.

Each thesis in the repository has been cleared where necessary by the author for third party copyright. If you would like a thesis to be removed from the repository or believe there is an issue with copyright, please contact us on [openaccess@leedsbeckett.ac.uk](mailto:openaccess@leedsbeckett.ac.uk) and we will investigate on a case-by-case basis.

## **Investigating the effect of walking football on the mental and social wellbeing of men.**

A weekly walking football intervention was delivered for men identified by mental health services with a mental health condition. Following familiarisation, an interviewer-led questionnaire captured demographic data. Semi-structured interviews were undertaken with (I) male attendees using an adapted version of Hargreaves and Pringle<sup>1</sup> and (II) the walking football programme lead. Interviews explored facilitators for engagement, benefits and key implementation considerations. Nine men attended of which seven participated in this research. Participants were white British, aged 25-44 years and living within 10 miles of the venue. Interviews identified the effect on social and mental health benefits including social support, connectedness and responsibility to fellow attendees of presenting each week. Distraction, achievement and confidence from playing football, as well as the development of skills were also identified as benefits. The intensity in which walking football was played helped facilitate inclusivity along with a stable local venue that helped accommodate different ability levels.

**Key words:** Walking football, social health, mental health, physical activity, intervention

### **Introduction**

Mental health represents the largest single cause of disability in the UK, with one in four adults expected to be diagnosed with a problem in any given year.<sup>2</sup> Symptoms associated with poor mental health can encompass physiological and psychological issues, as well as difficulties socialising and talking about how an individual is feeling.<sup>3</sup> The UK Government's physical activity (PA) recommendations highlight the important role that regular exercise can play in the promotion of good mental, social and physical health.<sup>4</sup> While more men than women meet the

1  
2  
3 recommended guidelines,<sup>5</sup> research has indicated that some men do not engage primary care  
4 services when they have a health condition, in doing so incubating health issues and reducing  
5 treatment options at a later date.<sup>6</sup> Investigations have identified that in those men who sought  
6 diagnosis for a mental health issue, three quarters did not discuss their condition with friends  
7 or family one month later.<sup>7</sup> Men may find the clinical support networks offered through health  
8 services to be unacceptable in meeting their needs.<sup>8</sup> Collectively this may leave some men  
9 feeling vulnerable, isolated and bereft of appropriate support networks.<sup>9</sup> Further, people  
10 experiencing poor mental health have lower PA levels than those who do not <sup>10</sup> and given the  
11 important role PA can play in mental wellbeing,<sup>11</sup> this is cause for concern.

57  
58  
59  
60  
With those thoughts in mind, innovative approaches are needed to engage people<sup>12</sup> including  
men, in health and PA interventions<sup>13</sup> and football has been suggested as just one channel for  
connecting a wide range of participants to PA programmes. This includes men dwelling in the  
local community and suffering with poor mental health<sup>14</sup> as well as those with limited social  
support networks.<sup>15</sup> It is no surprise then that a significant investment has been made by  
football's charities, Government's, football club community trusts and local health partners, <sup>16</sup>  
in programmes aimed to increase PA participation for the purposes of improving health,  
including men. Indeed, a number of studies confirm the effectiveness of football-based  
interventions for positively impacting on a number of key health conditions reported in the  
current PA guidelines including, overweight/obesity,<sup>17</sup> CVD,<sup>18</sup> dementia<sup>19</sup> and the effects of  
ageing.<sup>20</sup> In some cases, interventions which have proven to be effective in improving the health  
status of participants have been rolled out on a nationwide basis.<sup>21 2</sup>

Although the Government has published updated PA guidelines, Recent evidence suggests that  
for mental health benefits, PA does not need to be distributed across the week, as long as the  
recommended volume is combined into one or two sessions<sup>22</sup>. PA such as swimming and  
walking have shown potential to improve people's mood and mental health<sup>23</sup>. Whilst certain

1  
2  
3 interventions have found to reduce symptoms of depression; leading to a better quality of life  
4  
5  
6 <sup>24</sup>. Although an individual can choose to exercise alone or as part of a group, incorporating a  
7  
8 social aspect into PA has shown to improve mental wellbeing within certain population groups  
9  
10 <sup>25</sup>. Research on the role of football and mental health<sup>26</sup> and social health<sup>27</sup> is growing. Studies  
11  
12 have identified that participation in football as a mode of physical activity participation can  
13  
14 create peer support which can help with the recovery from poor mental health,<sup>28</sup> improve  
15  
16 confidence,<sup>29</sup> increase well-being, connectedness, symptom relief<sup>30</sup> and transformation of self-  
17  
18 stigma.<sup>31</sup> Further, football can help to improve social relations, enjoyment and exercise  
19  
20 continuation<sup>32</sup> as well as providing an opportunity to be physically active.<sup>33</sup> Football can also  
21  
22 provide a non-clinical setting for people with mental issues to work developmentally with  
23  
24 others<sup>34</sup> and as part of their recovery.<sup>35</sup> Further, playing walking football has been associated  
25  
26 with well-being and enhanced relationships.<sup>36</sup>

27  
28  
29  
30  
31 Recognizing that as men age, football in an un-adapted version (90 minute game time, full  
32  
33 pitches and running mode) may prove to be inaccessible for some aspirant participants due to  
34  
35 functional limitations, illness and injury,<sup>37</sup> whilst others may encounter barriers such as access,  
36  
37 cost and availability.<sup>38</sup> Although football will not appeal to all groups of men, more recently,  
38  
39 we have seen adapted versions of the game to include walking football.<sup>39</sup> Although based on  
40  
41 association football, the key difference in the rules, from the 'standard mode', is that if a player  
42  
43 runs then they concede a free kick to the opposition.<sup>40</sup> Despite the increase in popularity and  
44  
45 associated benefits of football, fewer studies have investigated the impact of walking football  
46  
47 on the mental and social wellbeing of men <sup>41</sup> as well as factors that help facilitate the  
48  
49 implementation of walking football programmes for men with poor mental health. With those  
50  
51 thoughts in mind, this study aimed to identify the effect of a walking football programme on  
52  
53 the mental and social health of men along with investigations into key implementation  
54  
55 considerations that may facilitate delivery.  
56  
57  
58  
59  
60

## Literature Review

Efforts to increase PA in people with serious mental health conditions are desirable, but little is known about how best to support this group<sup>42</sup>. PA such as swimming and walking have shown potential to improve people's mood and mental health<sup>43</sup>. These activities can be engaged on one's self or with other people depending on their own preferences<sup>44</sup>.<sup>45</sup> Further research, found that incorporating a social aspect into their PA intervention improved the mental health of their population group.

Study findings remain unclear on the benefits of exercise and physical activity interventions for people with serious mental health conditions<sup>46</sup>. Exercise based interventions have found to reduce symptoms of depression; leading to a better quality of life<sup>47</sup>. These interventions often combine social interaction in collaboration with exercise in non-psychiatric settings. Importantly, these interventions provide physical health benefits that are particularly crucial in a population where it is notably absent<sup>48</sup>.

Social isolation is another common issue which adds to an individual's stress and anxiety<sup>49</sup>.

A review of health improvement interventions delivered by Football Community Trusts in the English Football League identified that 82% delivered interventions aimed at promoting mental wellbeing, while all trusts provided PA interventions<sup>50</sup>. PA provided through football supports this notion and a number of studies<sup>51</sup> have shown how interventions, using the sport can tackle isolation and loneliness. Further, the Premier League Men's Health programme a national programme of men's health improvement delivered through 16 football club community trusts recruited hard-to-engage men presenting with multiple risk factors for CVD, not considering their health profile as a problem and not engaging primary health care services<sup>52</sup>. Over 18% (n=104/559) of men completing the programme showed a reduction in

1  
2  
3 health related stress with just under 9% (n=49/559) moving to a level where they felt that their  
4  
5 health had not suffered as a result. Overall, there were statistically significant reductions in  
6  
7 the health-related stress of completers from pre to post-intervention ( $Z = -4.40, p < .001$ ).

8  
9  
10 Importantly, over 15% of men completing the programme (n=101/662) showed a positive  
11  
12 change in social support with nearly 7% (n=45/662) moving to a level where they felt that  
13  
14 they had forged social support networks they could rely on in times of trouble <sup>53</sup>. As such  
15  
16 football-led health improvements can help recruit participants most in need of health  
17  
18 intervention including the provision of mental and social support which was harnessed  
19  
20 through football and PA provided through a football club community trust. Investigations  
21  
22 from the same programme identified attendees who reported increased social connectedness,  
23  
24 bonding and achievement. <sup>54</sup> Further, qualitative evidence suggests football increases social  
25  
26 skills, confidence and feelings of empowerment <sup>55</sup>. Despite this, it is still unclear whether it is  
27  
28 football or the social interactions which cause the positive effects <sup>56</sup>.

29  
30  
31 Football-led interventions offer an important opportunity to increase social connectedness and  
32  
33 inclusion <sup>57</sup>, whilst also providing a sense of achievement and empowerment <sup>58</sup>. Studies in  
34  
35 London, UK based on the “Coping Through Football” intervention identified higher levels of  
36  
37 quality of life and self-esteem <sup>59</sup>. Both of these measures were short-term follow ups and with  
38  
39 no long-term data collected, it is unclear how long these feelings lasted <sup>60</sup>.

40  
41  
42 Studies involving football as a vehicle <sup>61</sup>, have identified that individuals become more aware  
43  
44 of their activity levels as a result of attending a PA intervention, improving their moderate and  
45  
46 vigorous physical activity level. In addition, football is popular amongst a wide spread of  
47  
48 socio-economic and ethnic groups making it an inclusive option when implementing an  
49  
50 intervention <sup>62</sup>. This helps with psychotic problems in individuals who feel as though they are  
51  
52 not wanted in society <sup>63</sup>.

1  
2  
3 From a personal recovery perspective, the dominant paradigm in mental health service  
4 focuses on '*participation with*' individuals rather than administering mental health service  
5 users<sup>64</sup>. '*Male oriented*' team sports such as football are powerful vehicles for attracting men  
6 who experience a range of mental health conditions<sup>65</sup>. These sports help to foster the sharing  
7 of common interests and experiences, allowing service users to relate to one another and feel  
8 they are on a journey to recovery together<sup>66</sup>. However, the value and efficacy of these  
9 therapies can be questioned as they are still relatively new to the research field, in terms of  
10 therapeutic management. WF is a prime example, and whether the same health benefits are  
11 evident remains unclear. WF wasn't designed to improve cardiovascular fitness as the game is  
12 tailored to being inclusive for all, whatever physical ability however, it can be used as an  
13 initial platform to propel participants into more intense activities if they wish<sup>67</sup> and promote  
14 mental and social health benefits. Based on the current literature, there is scope for further  
15 understanding on WF and how it can be implemented within a community setting.

## 33 **Materials and Methods**

### 36 *Intervention context:*

37  
38 Unlike studies that have set out to co-design and implement a walking football programme with  
39 mental health professionals and service users,<sup>68</sup> this study investigated the impact of an existing  
40 community walking football programme on the mental health of men, including the barriers  
41 and facilitators to engagement. Such provision is important for helping individuals suffering  
42 from poor mental health.<sup>69</sup> as well as shaping future iterations of the programme delivery. In  
43 this study, a walking football intervention took place in a community leisure centre within a  
44 district of Leeds, Yorkshire, United Kingdom and was funded by the local authority and run by  
45 a Sports Development Officer. Sessions took place on a set afternoon each week and involved  
46 up to 60 mins playing walking football followed by an opportunity for men to meet and socialise  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 together. The session was held outdoors on the 4G pitch or indoors to accommodate the impact  
4  
5 of the weather and the UK seasons. A nominal fee of no more than £2.50 was charged to  
6  
7 participants, reduced for those with a participation loyalty card. The intervention ran  
8  
9 continuously and men could join at any time, so provided a flexible ‘hop on’ point. Participants  
10  
11 were eligible to attend the intervention if they were male and had been diagnosed as suffering  
12  
13 from a mental health condition and referred by a local mental health service. Prior to  
14  
15 engagement, attendees were assessed for their preparedness to take part in the intervention.  
16  
17 Participants could attend the session with the support of their care workers. As part of the  
18  
19 intervention, participants could also meet with the programme lead and discuss any issues  
20  
21 including those linked to their health and well-being and participation in the programme.<sup>70</sup>  
22  
23  
24  
25  
26

### 27 ***Research Context***

28  
29 Prior to recruitment, ethical approval was provided by [Blinded for Peer Review] University  
30  
31 and all participants were provided with pre-information on the study and consent forms and  
32  
33 consented to participate in the evaluation on a voluntary basis. To help facilitate recruitment  
34  
35 and data collection, the lead researcher attended the programme over a period of five months  
36  
37 to become familiar with the context where the intervention was delivered, as well as build up  
38  
39 rapport and relationships with participants and potential volunteers for this study.<sup>71</sup> In some  
40  
41 cases, the researcher also took part in the sessions and this approach has proved to be effective  
42  
43 in facilitating researcher acceptance and building up rapport as seen elsewhere.<sup>72</sup>  
44  
45  
46  
47  
48

49 Demographic information, age, ethnicity, gender, postcode and use of health services was  
50  
51 captured using a self-report questionnaire.<sup>73</sup> There is a need for investigations that allow  
52  
53 participants to report their experiences and also how walking football impacts on their well-  
54  
55 being,<sup>74</sup> along with the views of participants and delivery staff that help provide insights into  
56  
57 key implementation considerations, useful for those planning interventions.<sup>75</sup> As such, semi-  
58  
59  
60

1  
2  
3 structured interviews were undertaken with participants and the programme lead. This study  
4 adapted Hargreaves and Pringle's<sup>76</sup> procedures that had previously been deployed to investigate  
5 the impact of mental health improvement programmes delivered by professional football club  
6 community trusts and focussed on the traditional version of the game of football. This was  
7 selected because their approach was deemed acceptable when engaging men with mental health  
8 issues and also effective in discovering insightful accounts on how a community football  
9 programme has impacted the mental and social well-being of men. Further, it identified key  
10 design considerations which are important for planning interventions for promoting physical  
11 activity and mental wellbeing.<sup>77</sup> Interviews took place in a meeting room at the leisure centre  
12 either before or after the session had taken place. This allowed the participants to be in a  
13 comfortable, familiar environment as recommend elsewhere.<sup>78</sup> Interviews were undertaken by  
14 the lead researcher and lasted between 45 and 60 minutes, were digitally recorded and  
15 transcribed verbatim. This study was conducted in 2019.

### 33 ***Data Analysis***

34  
35  
36 Following transcription, researchers followed the six steps in Braun and Clarke's thematic  
37 analysis to ensure a pragmatic and trustworthiness process.<sup>79</sup> This approach has been used in  
38 investigations of football-led health improvement programmes<sup>80</sup> and highlighted as good  
39 practice.<sup>81</sup> Following transcription and reading of the interview transcripts to saturation, coding  
40 identified interesting features in the data and these were grouped into coherent themes

41  
42  
43 A thematic map was generated where two researchers (Blinded for Peer Review) came together  
44 to compare their individual analysis of the transcripts to consolidate and agree on themes. Using  
45 these themes, excerpts from participants are provided in the results. Basic frequencies are  
46 reported in the text for demographics as seen elsewhere.<sup>82</sup>

### 58 **Results**

### *Demographics*

Out of a total of nine regular attendees, n=7 men volunteered to participate in the research aged 25-34 (n=5) and 33-44 years (n=2). All were White British living within 10 miles of the delivery venue. All participants reported engaging with health services in the last five years.

### *Impact on social and mental well-being*

In their interviews, men reported a range of mental health issues including, depression, anxiety, agoraphobia, schizophrenia attempted suicide, gambling and also feeling they had a lack of focus and purpose. All men had been referred to the programme by a community mental health service due to their condition.

### *Social ties*

Men reported meeting up on a weekly basis to discuss any issues they had with participants. Further, as members had been part of the programme for two years' they enjoyed socialising and developing friendships. This allowed them to discuss any personal issues they had and was cited as key factor by the programme lead. As socialisation increased, one member is now helping to organise an additional session

**P1:** It's just coming down and the chance to see my mates.

**P2:** It's like when I first started, I didn't really know them all that well... they encourage me to come every week and I've developed a bit more of a friendship.

**PL:** I know the social element it's one of the biggest things as they feel as though they're letting other people down if you don't come.

**P3:** It's nice to just get together at the end and just talk and chat about any issues... it's a good way of getting to know one another rather than just as teammates.

1  
2  
3 **P1:** Yeah so I'm trying set up a five aside one night a week, because we all want play  
4 more together.  
5  
6

7  
8 *New lease of life*  
9

10  
11 Men reported that through walking football they had renewed purpose and engaged with other  
12 forms of activity outside of football.  
13  
14

15  
16 **P3:** I'm going to be 49 next but that doesn't mean my life is over... to be honest I wasn't  
17 getting out much... I was inclined on staying in most of the time, but this has brought me  
18 confidence to go and do stuff again... I'm like a Yo-Yo now bounding up and down.  
19  
20  
21

22  
23 **P6:** Playing football has made me want to go back to the gym and increase my fitness  
24 levels further.  
25  
26  
27

28  
29 *Feeling confident and accomplished*  
30

31  
32 Men reported that participating in walking football left them feeling more confident in their  
33 appearance and ability. From a deliverer's perspective, men reported achievements beyond  
34 playing football.  
35  
36  
37

38  
39 **P1:** The chap who runs [Programme Lead] says I've come on leaps and bounds and can  
40 definitely tell that I've lost weight since I started the program... which makes me feel  
41 really good. I feel a little bit of accomplishment, like I've achieved something.  
42  
43  
44

45  
46 **PL:** Many men have never played football before so for some people it might be that or  
47 their weight whereas the other one have been able to stop gambling as a result of the  
48 program and that boosts their confidence.  
49  
50  
51  
52

53  
54 *Transferable skills*  
55  
56  
57  
58  
59  
60

1  
2  
3 Participating in walking football led to the development of skills. In particular, leadership skills  
4  
5 were identified and in turn meant men were able to take these into work situations.  
6  
7

8 **P1:** Walking football has improved my communication and decision making... in my  
9  
10 spare time I now feel comfortable being able to do things on my own and make decisions  
11  
12 for myself.  
13  
14

15 **P5:** People look up to me as one of the better players and I enjoy organising people at set  
16  
17 pieces and positions on the pitch.  
18  
19

20 **P3:** I now manage a lot of special needs workers and they don't get a lot of coaching on  
21  
22 how to deal with people with special needs... but I'd say (the programme) has definitely  
23  
24 improved my leadership qualities.  
25  
26  
27

### 28 *Distraction*

29  
30 Walking football was a distraction from current feelings and cleared the minds of any  
31  
32 negative thoughts.  
33  
34  
35

36 **P4:** Before I come, I don't feel (mentally) great... but I know even if I'm having a bad  
37  
38 day it will help me feel better... when I'm playing football, I don't want it to end.  
39  
40

41 **PL:** ...Something to detach themselves from what goes on in their lives so the  
42  
43 concentration required to play football they've got to no opportunity to think about other  
44  
45 things and talk about anything else.  
46  
47  
48

### 49 *Planning and decision making*

50  
51 As walking football was played at a slower tempo, the men were afforded time to think about  
52  
53 their actions both before and during the game. Translating these processes outside of football  
54  
55 participants were able to establish a structure to their week. In addition, dietary choices and  
56  
57 preparations prior to the game were also reported.  
58  
59  
60

1  
2  
3 **P1:** ...it's not all about the running, the walking gives you more time to think... you  
4  
5 know when to lay off the ball.  
6  
7

8 **P5:** Before I play football, I prepare for it the night before, so I'll eat healthier and try to  
9  
10 moderate my carbohydrates and water levels.  
11  
12

13 **P2:** It's like now I'll play my football and then go to the snooker club... then Thursday  
14  
15 I'll do my food shopping and get stuff sorted at home, which means on a Friday I can  
16  
17 have a chill day. I never really used to have that good routine before I came here.  
18  
19

### 20 21 *Factors facilitating programme engagement*

#### 22 23 24 *Signposting*

25  
26  
27 Having a strong relationship with a local Community Mental Health Service was key for  
28  
29 programme engagement. Men trusted the service and knew it would help them with their  
30  
31 mental health  
32

33  
34 **PL:** ...Despite there only being three people who turned up in the first week... walking  
35  
36 football soon grew in popularity across the city as more people became aware.  
37  
38

39  
40 **P5:** It was the crisis team who referred me onto the programme because I had a few  
41  
42 battles with depression and they had to get involved because of an attempted [suicide].  
43  
44 They told me about this really good project and it all started from there really.  
45  
46

#### 47 48 *Support from care workers and staff*

49  
50 Care workers also signposted men to the programme and in some cases accompanied men to  
51  
52 the sessions. Support was extended from the venues staff, who were singled out for their  
53  
54 importance in helping the men settle.  
55  
56  
57  
58  
59  
60

1  
2  
3 **P7:** The programme got recommended to me by my support worker, who attended the  
4 session with another gentlemen. I am always motivated to play football so I thought I  
5 would give it a go.  
6  
7  
8

9  
10 **P4:** If my care worker didn't come with me initially I probably wouldn't be here... even  
11 with them being by my side, the first time I came was really nervous... meeting new  
12 people.  
13  
14  
15

16  
17 **PL:** Being inclusive to all new members and supporting them helped to develop a  
18 respect between the leisure centre and members. We had one person who had their  
19 benefits taken away but they still let the person come for free for two months whilst  
20 they were going through their appeal process to sort it all out. As a result of the faith  
21 that they put in that man; when they sorted everything out in terms of his benefits he  
22 came in and paid straight away from its first session back.  
23  
24  
25  
26  
27  
28  
29  
30

31  
32  
33 *Inquisitive, Learning and Developing new skills*  
34

35 Most men had never heard of walking football before and were inquisitive to learn how to play  
36 a new format of football. Men reported developing their skills and becoming better at playing  
37 football; motivating them to maintain the programme. The idea of developing themselves  
38 further helped the men to identify latent ability and in one participant they were trained to run  
39 sessions and step in for the programme leader.  
40  
41  
42  
43  
44  
45  
46

47 **P2:** I'm able to learn new skills every week... I never played football before and I just  
48 constantly enjoy learning new things.  
49  
50

51  
52 **P1:** I was like a two-year old when I first started, I had two left feet... now I've come on  
53 leaps and bounds... I understand where to position myself on the pitch if we have a two  
54 on one to score a goal.  
55  
56  
57  
58  
59  
60

1  
2  
3 **P5:** Since I've been here, I have gone on to play for a team called Danby Rovers which  
4 is played at a higher level.  
5  
6

7  
8 **P3:** ...yeah so I am being trained up to do my level 1 coaching... I like the possibility of  
9 being in control.  
10  
11

### 12 *Competition*

13  
14  
15  
16 Competition was important for men with a sporting background however, for some it became  
17 difficult to switch mindsets.  
18  
19

20  
21  
22 **P1:** I used to play rugby competitively before I snapped my vertebrae, now I just enjoy  
23 playing a team game again which we can end up winning... that's one of the main reasons  
24 I enjoy coming; to see who wins.  
25  
26  
27

28  
29 **P5:** I enjoy the competitive edge, but I can't be too competitive here because that's not  
30 what everybody comes here for.  
31  
32  
33

### 34 *Location and familiarity*

35  
36  
37 A structured location and time each week help make life easier for participants and was deemed  
38 important by delivery staff. Further, the men appreciated the opportunity to play both in and  
39 outdoors.  
40  
41  
42

43  
44  
45 **P4:** I'm really familiar with the staff and I feel really comfortable... commuting [to the  
46 session] I understand where I'm going... and that's important for me.  
47  
48

49  
50 **P3:** Yeah, I timetable the sessions into my routine every week.  
51  
52

53  
54 **PL:** I think part of the pull of the venue was the fact that it was linked [ a community  
55 mental health service] and if we moved venue it would work for some people but it won't  
56 work for others.  
57  
58  
59  
60

1  
2  
3 **P7:** I really enjoy playing football outside, but I realise this is weather dependant.  
4  
5  
6  
7  
8

## 9 **Discussion**

10  
11  
12 Men who presented a range of mental health issues were referred to walking football by a  
13 community mental health service. Notwithstanding the physical health benefits of taking part,<sup>83</sup>  
14 men reported mental and social health benefits which improved their well-being<sup>84</sup> and  
15 positively contributed to their daily lives. Moreover, the reports of men provided important  
16 implementation considerations for future delivery of the programme.  
17  
18  
19  
20  
21  
22

23  
24 In facilitating these outcomes, attendees felt that walking football was inclusive and could  
25 accommodate different abilities and fitness levels and men felt they were capable of taking part.  
26  
27 Participants enjoyed and expressed a desire to play football and this contributed to  
28 engagement.<sup>85</sup> Football is typically a team game, and an important factor facilitating both  
29 adoption and maintenance were the social benefits of taking part. Talking to likeminded men  
30 about their mental health issues, developing friendships and ties,<sup>86</sup> enhanced relationships<sup>87</sup>  
31 were all important outcomes. Further, it created a perceived responsibility in attendees not to  
32 let other participants down by not turning up. This was linked to reports on the positive impacts  
33 on men's mental wellbeing and similar to outcomes found for full versions of football delivered  
34 by football club community trusts.<sup>88</sup> Given that some men do not engage in healthcare systems<sup>89</sup>  
35 and that others do not discuss their mental health with family members<sup>90</sup> or have support  
36 networks,<sup>91</sup> regular opportunities for men to have contact with like-minded men become  
37 precious<sup>92</sup> as men in this study talked to other men about their situations.  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53

54 Participation in PA has been shown to provide benefits to mental and social health<sup>93</sup> as well as  
55 recovery from mental health conditions.<sup>94</sup> In this study, men reported benefits linked to  
56 participation in PA through walking football, including distraction from the rigors of daily  
57  
58  
59  
60

1  
2  
3 life,<sup>95</sup> achievements in playing the game,<sup>96</sup> developing new and refining skills such as  
4 communication,<sup>97</sup> or decision making or executing a football skills.<sup>98</sup> In some cases, men had  
5  
6 also been trained up as football coaches and led the sessions in the programme or organised  
7  
8 extra sessions for fellow attendees. Men also reported experiencing accomplishment, feeling  
9  
10 more confident<sup>99</sup> and experiencing greater positivity.<sup>100</sup> However men's views of , the role of  
11  
12 competition in the game was mixed, while it appealed to some men<sup>101</sup> for others it was less  
13  
14 important.<sup>102</sup> In some cases, it was off putting as some individual's competitive nature took  
15  
16 over.<sup>103</sup> Fellow studies <sup>104</sup> have suggested that walking football offers a 'therapeutic'  
17  
18 environment with more 'explicit talk about fair play' and inclusivity of less able participants.  
19  
20 These were features that emerged from the discussions with participants in this study and  
21  
22 programme leads must consider how to balance these needs with those men requiring greater  
23  
24 competition. This might include managing participant's expectations and developing  
25  
26 complimentary provision.  
27  
28  
29  
30  
31  
32

33  
34 A number of men reported that before attending, they lacked focus and had 'little going on in  
35  
36 their lives', but that engagement in the programme provided some with a 'renewed purpose',  
37  
38 and structure to their daily lives.<sup>105</sup> When men took on formal (coaching) or informal leadership  
39  
40 roles in the group they also reported feeling positive about their new responsibilities such as  
41  
42 volunteering. This was enhanced when the programme lead reflected encouraging comments  
43  
44 on and toward men regarding progress and improvements wellbeing. Indeed, programme staff  
45  
46 have been identified as important conduits in men's health improvement programmes.<sup>106</sup>  
47  
48  
49

50  
51 The programme venue was an important facilitator for men's engagement. The leisure centre  
52  
53 that hosted the intervention was familiar, accessible and eased initial anxiety amongst attendees  
54  
55 when they first participated. To help with the initial uptake of PA a relationship needs to be  
56  
57 developed between the individual and the service so trust can be formed.<sup>107</sup> A flexible approach  
58  
59 where men start at any time and be accompanied with care workers also facilitated  
60

1  
2  
3 engagement.<sup>108</sup> Further, committed staff<sup>109</sup> with the right mix of skills, who understand  
4 participant needs and could offer words of encouragement were valued by men, as seen  
5 elsewhere.<sup>110</sup> A combination of staffing skills/qualities<sup>111</sup> alongside local, familiar and stable  
6 environments<sup>112</sup> and appealing programme content it was important there was a supportive  
7 environment and was integral for meeting the key needs of men with mental health issues.  
8  
9

10  
11 This study has several strengths and limitations. Limitations include the small sample made up  
12 of white British men aged 25-44 years. However, strengths relate to engaging the majority of  
13 participants attending this programme in this research. Further, the adoption of a peer-review  
14 methodology<sup>113</sup> as well as the building up of relationships with participants, which combined  
15 to secure insightful accounts from participants on the experiences of men including the benefits  
16 they encountered. The study provides helpful design considerations for those planning similar  
17 interventions with this group as recommended in the literature.<sup>114</sup>

## 38 **Conclusion**

39  
40 Sport and PA offers a social space to work with those who suffer and connect people to socially  
41 supportive networks.<sup>115</sup> Notwithstanding the physical health benefits from talking in part in a  
42 weekly a walking football programme, men referred by a community mental health service  
43 reported benefits mental and social health benefits that positively impacted on their wellbeing  
44 and their lives. Men enjoyed playing football and an adapted version of the game facilitated  
45 inclusion. The local venue, supportive delivery staff, and a signposting from mental health  
46 services are also important delivery considerations for those planning similar interventions.
